| 5.1.3.1  | Configuring Codecs.....                                       | 41        |
| 5.1.3.2  | Supported Codecs.....                                         | 41        |
| 5.1.3.3  | Packetization Time .....                                      | 42        |
| 5.1.4    | Configuring Voice and Fax Parameters.....                     | 42        |
| 5.1.5    | Configuring Services Parameters.....                          | 43        |
| 5.1.6    | Configuring Line Settings Screen .....                        | 46        |
| 5.1.7    | Configuring Speed Dial Settings.....                          | 47        |
| <b>6</b> | <b>Connecting the MP-202 to a VoIP Service Provider .....</b> | <b>51</b> |
| 6.1      | Opening a SIP Account.....                                    | 51        |
| 6.2      | Configuring VoIP Parameters .....                             | 51        |
| <b>7</b> | <b>Making VoIP Calls .....</b>                                | <b>53</b> |
| 7.1      | Placing a Call .....                                          | 53        |
| 7.2      | Answering a Waiting Call .....                                | 53        |
| 7.3      | Putting a Call on Hold .....                                  | 53        |
| 7.4      | Performing a Call Transfer .....                              | 54        |
| 7.5      | Establishing a 3-Way Conference.....                          | 54        |
| 7.6      | Forwarding Calls to Another Phone .....                       | 55        |
| <b>8</b> | <b>Quality of Service (QoS) .....</b>                         | <b>57</b> |
| 8.1      | Traffic Shaping .....                                         | 57        |
| 8.1.1    | Device Traffic Shaping.....                                   | 57        |

|           |                                                                        |           |
|-----------|------------------------------------------------------------------------|-----------|
| 8.1.2     | Shaping Classes .....                                                  | 59        |
| 8.1.2.1   | Class Rules .....                                                      | 62        |
| 8.2       | Traffic Priority .....                                                 | 64        |
| 8.3       | DSCP Mapping .....                                                     | 66        |
| 8.4       | 802.1p Mapping .....                                                   | 68        |
| 8.5       | Class Statistics .....                                                 | 69        |
| 8.6       | Configuring Basic VoIP QoS .....                                       | 70        |
| <b>9</b>  | <b>WAN Settings .....</b>                                              | <b>73</b> |
| 9.1       | WAN Ethernet .....                                                     | 73        |
| 9.1.1     | General .....                                                          | 74        |
| 9.1.2     | Internet Protocol Settings .....                                       | 75        |
| 9.1.3     | DNS Server .....                                                       | 76        |
| 9.1.4     | Routing .....                                                          | 76        |
| 9.1.5     | Advanced Routing Properties .....                                      | 77        |
| 9.1.6     | Internet Connection Firewall .....                                     | 77        |
| 9.2       | WAN PPPoE .....                                                        | 78        |
| 9.2.1     | General .....                                                          | 78        |
| 9.2.2     | PPP Configuration .....                                                | 78        |
| 9.2.3     | PPP Authentication .....                                               | 79        |
| 9.2.4     | PPP Encryption .....                                                   | 80        |
| 9.2.5     | PPP Compression .....                                                  | 81        |
| 9.2.6     | Internet Protocol .....                                                | 82        |
| 9.2.7     | DNS Server .....                                                       | 82        |
| 9.2.8     | Routing .....                                                          | 82        |
| 9.2.9     | Internet Connection Firewall .....                                     | 82        |
| 9.3       | WAN PPTP .....                                                         | 82        |
| 9.3.1     | Creating a PPTP Connection with the Connection Wizard .....            | 82        |
| 9.3.2     | Creating a PPTP VPN Connection with the Connection Wizard .....        | 85        |
| 9.3.3     | General .....                                                          | 87        |
| 9.3.4     | PPP Configuration .....                                                | 87        |
| 9.3.5     | PPP Authentication .....                                               | 88        |
| 9.3.6     | PPP Encryption .....                                                   | 88        |
| 9.3.7     | Internet Protocol .....                                                | 88        |
| 9.3.8     | DNS Server .....                                                       | 88        |
| 9.3.9     | Routing .....                                                          | 88        |
| 9.3.10    | Internet Connection Firewall .....                                     | 88        |
| 9.4       | WAN L2TP .....                                                         | 89        |
| 9.4.1     | Creating an L2TP IPsec VPN Connection with the Connection Wizard ..... | 89        |
| 9.4.2     | Creating an L2TP IPsec VPN Connection with the Connection Wizard ..... | 92        |
| 9.4.3     | General .....                                                          | 95        |
| 9.4.4     | PPP Configuration .....                                                | 95        |
| 9.4.5     | PPP Authentication .....                                               | 96        |
| 9.4.6     | PPP Encryption .....                                                   | 96        |
| 9.4.7     | PPP Compression .....                                                  | 96        |
| 9.4.8     | Internet Protocol .....                                                | 96        |
| 9.4.9     | DNS Server .....                                                       | 96        |
| 9.4.10    | Routing .....                                                          | 96        |
| 9.4.11    | Internet Connection Firewall .....                                     | 97        |
| <b>10</b> | <b>VLAN and Bridge Settings .....</b>                                  | <b>99</b> |
| 10.1      | Virtual LAN Interface (VLAN) .....                                     | 99        |
| 10.1.1    | Creation with the Connection Wizard .....                              | 99        |
| 10.1.2    | General .....                                                          | 100       |

|           |                                                                  |            |
|-----------|------------------------------------------------------------------|------------|
| 10.1.3    | IP Address Distribution .....                                    | 103        |
| 10.1.4    | Routing.....                                                     | 105        |
| 10.1.5    | Internet Connection Firewall .....                               | 107        |
| 10.1.6    | Allow Unrestricted Administration .....                          | 107        |
| 10.1.7    | Additional IP Addresses.....                                     | 108        |
| 10.1.8    | Example of Configuring 3 VLANs: VoIP, Data and Management .....  | 108        |
| 10.2      | WAN-LAN Bridge .....                                             | 115        |
| 10.2.1    | Creation with the Connection Wizard .....                        | 115        |
| 10.2.2    | General .....                                                    | 118        |
| 10.2.3    | Internet Protocol Settings .....                                 | 118        |
| 10.2.4    | Bridge Settings .....                                            | 119        |
| 10.2.5    | Examples of Configuring VLANs in Bridge Mode.....                | 120        |
| 10.2.5.1  | Example 1 - Configuring 3 VLANs: VoIP, Data and Management.....  | 120        |
| 10.2.5.2  | Example 2 - Configuring Tagged VoIP, Untagged Data Traffic ..... | 124        |
| 10.2.5.3  | Example 3 - Configuring VoIP and Data in the Same VLAN .....     | 128        |
| <b>11</b> | <b>TR-069 CPE WAN Management Protocol .....</b>                  | <b>131</b> |

**Tip:** When viewing this manual on CD, Web site or on any other electronic copy, all cross-references are hyperlinked. Click on the page or section numbers (shown in blue) to reach the individual cross-referenced item directly. To return back to the point from where you accessed the cross-reference, press Alt + ← .

## Trademarks

All products or trademarks are property of their respective owners.

## WEEE EU Directive

Pursuant to the WEEE EU Directive, electronic and electrical waste must not be disposed of with unsorted waste. Please contact your local recycling authority for disposal of this product.

## Customer Support

The Nuera Technical Assistance Center (TAC) is available on 7 x 24 hour basis for any maintenance or service-related issue on the Nuera product line. A Nuera maintenance contract is required to access the TAC center. The TAC center can be reached via:

- US: 1-800-966-8372 opt 3
- International: + 1-858-625-9220 opt 3
- Email: [tac@nuera.com](mailto:tac@nuera.com)

The TAC center maintains a support page on Nuera's web site: [www.nuera.com/support](http://www.nuera.com/support). The site includes information on support services as well as a download page that includes relevant Technical Advisory Bulletins, updated software releases and manuals. First-time users of the download services must request a login account and password from TAC by phone or email.

## Abbreviations and Terminology

Each abbreviation, unless widely used, is spelled out in full when first used. Only industry-standard terms are used throughout this manual. Hexadecimal notation is indicated by 0x preceding the number. When the term 'device' is used, it refers to the MP-202 Telephone Adapter.

# 1 Introducing the MP-202 Telephone Adapter

The MP-202 is a 2-line SIP gateway allowing residential and SOHO subscribers to connect ordinary POTS telephones or fax machines, and is interoperable with leading Softswitches and SIP Application Servers for enabling legacy phone services such as caller ID, call waiting, and call forwarding. In addition, the MP-202 includes an internal router with DHCP, NAT, Firewall, PPPoE, PPTP and L2TP capabilities enabling subscribers to connect their home PC or LAN hub/switch to it.

Utilizing Nuera's core architecture, and gaining from its accumulated experience in providing IP telephony solutions, the MP-20x series combines superior voice quality and state-of-the-art features for end users, such as T.38 Fax Relay and G.168-2004 compliant Echo Cancellation. Low bit-rate vocoders (voice coders) can be used simultaneously on both telephony ports to save valuable bandwidth. The Voice over Data prioritization algorithm prevents degradation in voice quality even during large data transfers.

The MP-20x Series is designed for full interoperability with leading Softswitches and SIP Servers for deployment in various network environments. Throughout the years, Nuera has invested significant effort in complying with the leading and evolving VoIP standards. Support of the Session Initiation Protocol (SIP), which is commonly found in Voice over Broadband (VoB) networks, assures seamless integration and rapid deployment.

## 2 Cabling the MP-202 Telephone Adapter

➤ **To cable the MP-202, take these steps:**

1. Connect the MP-202's Ethernet 10/100 Base-T RJ-45 connector labeled 'WAN' to your cable or DSL modem (or other network connection).
2. Connect the MP-202's Ethernet 10/100 Base-T RJ-45 connector labeled 'LAN/PC' to a PC.
3. Optionally, you can connect the MP-202's connector labeled 'LAN/PC' to a switch / hub and connect multiple PCs to the latter.
4. Connect the MP-202's two RJ-11 ports labeled 'PHONE 1' and 'PHONE 2' to two analog telephones.
5. Connect the power cable to the power supply; the green LEDs illuminate; the power-up process takes approximately 40 seconds. When the power up process ends, 'Phone 1' and 'Phone 2' LEDs turn off; off-hook a phone and listen for a dial tone.

**Figure 2-1: Cabling the Device**

## 3 Setting up a Network Connection

➤ **To set up a network connection:**

1. Define your PC's network connection (refer to 'Defining Your PC's Network Connection' on page [17](#))
2. Configure the MP-202's network connection (refer to 'Configuring the MP-202's Network Connection' on page [19](#))

### 3.1 Defining Your PC's Network Connection

Refer to MP-202 Telephone Adapter Quick Installation Guide for instructions relating to installation on a Windows™ operating system.

Each network interface on the PC should either be configured with a statically defined IP address and DNS address, or should be instructed to automatically obtain an IP address using the Network DHCP server.

The MP-202 provides a DHCP server on its LAN and it is recommended to configure your PC to obtain its IP and DNS server IPs automatically.

This configuration principle is identical but performed differently on each operating system.

Refer to 'Windows XP' on page [18](#)

Refer to 'Windows 2000' on page [19](#)

Refer to 'Windows NT' on page [19](#)

Refer to 'Linux' on page [19](#)

**Note:** The setup procedure is in most cases unnecessary due to Windows' default network settings. For example, the default DHCP setting in Windows 2000 is 'client', requiring no further modification. It is advisable however to follow the setup procedure in order to verify that all communication parameters are valid and that the physical cable connections are correct.

**Figure 3-1: IP and DNS Configuration**

### 3.1.1 Windows XP

1. Access 'Network Connections' from the Control Panel.
2. Right-click on the Ethernet connection icon, and select 'Properties'.
3. Under the 'General' tab, select the 'Internet Protocol (TCP/IP)' component, and press the 'Properties' button.
4. The 'Internet Protocol (TCP/IP)' properties window will be displayed.
5. Select the 'Obtain an IP address automatically' radio button.
6. Select the 'Obtain DNS server address automatically' radio button.
7. Click 'OK' to save the settings.

### 3.1.2 Windows 2000

1. Access 'Network and Dialing Connections' from the Control Panel.
2. Right-click on the Ethernet connection's icon, and select 'Properties' to display the connection's properties.
3. Select the 'Internet Protocol (TCP/IP)' component, and press the 'Properties' button.
4. The 'Internet Protocol (TCP/IP)' properties will be displayed.
5. Select the 'Obtain an IP address automatically' radio button.
6. Select the 'Obtain DNS server address automatically' radio button.

### 3.1.3 Windows NT

1. Access 'Network' from the Control Panel to display the network control panel.
2. From the 'Protocol' tab, select the 'Internet Protocol (TCP/IP)' component, and press the 'Properties' button.
3. From the 'IP Address' tab select the 'Obtain an IP address automatically' radio button.
4. From the 'DNS' tab, verify that no DNS server is defined in the 'DNS Service Search Order' box and no suffix is defined in the 'Domain Suffix Search Order' box.

### 3.1.4 Linux

1. Login into the system as a super-user, by entering `su` at the prompt.
2. Type 'ifconfig' to display the network devices and allocated IP's.
3. Type 'pump -i <dev>', where <dev> is the network device name.
4. Type 'ifconfig' again to view the new allocated IP address.
5. Make sure no firewall is active on device <dev>.

## 3.2 Configuring the MP-202's Network Connection

The Web-based management interface of the MP-202 allows you to control the device's system parameters. The interface is accessed through a Web browser. For detailed information on the gateway's Web-management interface, refer to 'Using the MP-202's Web Interface' on page [27](#)

➤ **To access the Web-based management interface:**

1. Launch a Web browser on your PC.

2. With your PC connected directly to the MP-202, use URL <http://mp202.home> to access the Web-based management interface; the 'Welcome to Your MP-202' screen appears (refer to the figure); you can click the link 'Add to Favorites' to add a shortcut to the screen in your 'Favorites' folder for future access.

**Figure 3-2: 'Welcome' Screen**

3. Press 'OK' to continue; the 'Login Setup' screen appears (refer to the figure).

### 3.2.1 Logging In

The figure below shows the Logging In screen.

**Figure 3-3: Logging In**

#### ➤ To log in, take these steps:

1. The default User Name is 'admin' (note that it is case sensitive). It is recommended to define a password.
2. To verify that the Password is correct, retype it and press 'OK'; the 'Quick Setup' screen opens (refer to the figure).

**Note:** Make sure you retain your User Name and Password for future reference as this is the only way you can access and manage the MP-202.

**Note:** If there's inactivity after logging in, a new login becomes necessary after a lapse of 15 minutes.

### 3.2.2 Configuring 'Quick Setup' Screen Parameters

The 'Quick Setup' screen (refer to the figure) enables the speedy, precise, and accurate configuration of your Internet connection and other important parameters.

Figure 3-4: Quick Setup

The screenshot shows the 'Quick Setup' interface. At the top, there is a gear icon and the text 'Quick Setup'. Below this, the 'Internet Connections' section is highlighted. Under 'WAN Ethernet', there is a table of configuration parameters:

| WAN Ethernet     |                                          |
|------------------|------------------------------------------|
| Connection Type: | Automatic IP Address Ethernet Connection |
| Name:            | WAN Ethernet                             |
| Status:          | Connected                                |
| MAC Address:     | 00:90:8f:09:ef:5e                        |
| IP Address:      | 10.33.2.42                               |
| Subnet Mask:     | 255.255.0.0                              |
| Default Gateway: | 10.33.0.1                                |
| DNS Server:      | 10.1.1.11<br>10.1.1.10                   |

Below the Internet Connections section is the 'Administrator' section with two input fields:

| Administrator     |       |
|-------------------|-------|
| MP202's Hostname: | MP202 |
| E-Mail:           |       |

At the bottom, there is a text prompt: 'Press the **Refresh** button to update the status.' and four buttons: 'OK', 'Apply', 'Cancel', and 'Refresh'.

**Note:** End users are advised not to modify the section 'Administrator' in the 'Quick Setup' screen. The screen section applies to telephony carrier technicians.

In the 'Administrator' section of the 'Quick Setup' screen:

- Specify the device's host name in the 'Hostname' field. This host name is used to access the device's Web-based management.
- Specify the administrator's e-mail in the 'E-mail' field. System alerts and notifications are sent to this address.

#### 3.2.2.1 Configuring Your Internet Connection

When subscribing to a broadband service, you should be aware of the method by which you are connected to the Internet. Technical information regarding the properties of your Internet connection should be provided by your Internet Service Provider (ISP). For example, your ISP should inform you whether you are connected to the Internet using a static or dynamic IP address, or what protocols, such as PPTP or PPPoE, you will be using to communicate over the Internet.

### 3.2.2.1.1 Automatic IP Address Ethernet Connection

'Automatic IP Address Ethernet Connection' is the default connection type (refer to parameter 'Connection Type' drop-down list in the figure below).

**Figure 3-5: Internet Connection - Automatic IP Address Ethernet Connection**

The screenshot shows the 'Quick Setup' window with the 'Internet Connections' section. Under 'WAN Ethernet', the 'Connection Type' is set to 'Automatic IP Address Ethernet Connection'. The status is 'Connected'. The IP Address is 10.33.2.42, Subnet Mask is 255.255.0.0, and Default Gateway is 10.33.0.1. The DNS Servers are 10.1.1.11 and 10.1.1.10. The Administrator section shows the MP202's Hostname as 'MP202' and an empty E-Mail field. At the bottom, there are buttons for OK, Apply, Cancel, and Refresh, along with a note to press the Refresh button to update the status.

| Internet Connections |                                          |
|----------------------|------------------------------------------|
| WAN Ethernet         |                                          |
| Connection Type:     | Automatic IP Address Ethernet Connection |
| Name:                | WAN Ethernet                             |
| Status:              | Connected                                |
| MAC Address:         | 00:90:8f:09:ef:5e                        |
| IP Address:          | 10.33.2.42                               |
| Subnet Mask:         | 255.255.0.0                              |
| Default Gateway:     | 10.33.0.1                                |
| DNS Server:          | 10.1.1.11<br>10.1.1.10                   |

| Administrator     |       |
|-------------------|-------|
| MP202's Hostname: | MP202 |
| E-Mail:           |       |

Press the **Refresh** button to update the status.

OK Apply Cancel Refresh

If left at the default, the MP-202 will obtain the WAN IP and DNS IP addresses from a DHCP server on the WAN.

### 3.2.2.1.2 Manual IP Address Ethernet Connection

- Select 'Manual IP Address Ethernet Connection' from the 'Connection Type' drop-down list (refer to the figure).

**Figure 3-6: Internet Connection - Manual IP Address Ethernet Connection**

The screenshot shows the 'Quick Setup' window with the 'Internet Connections' section. Under 'WAN Ethernet', the 'Connection Type' is set to 'Manual IP Address Ethernet Connection'. The IP Address, Subnet Mask, Default Gateway, Primary DNS Server, and Secondary DNS Server fields are all empty. The Administrator section shows the MP202's Hostname as 'MP202' and an empty E-Mail field. At the bottom, there are buttons for OK, Apply, and Cancel.

| Internet Connections  |                                       |
|-----------------------|---------------------------------------|
| WAN Ethernet          |                                       |
| Connection Type:      | Manual IP Address Ethernet Connection |
| IP Address:           |                                       |
| Subnet Mask:          |                                       |
| Default Gateway:      |                                       |
| Primary DNS Server:   |                                       |
| Secondary DNS Server: |                                       |

| Administrator     |       |
|-------------------|-------|
| MP202's Hostname: | MP202 |
| E-Mail:           |       |

OK Apply Cancel

According to your ISP's instructions, specify the following parameters:

- IP address
- Subnet mask
- Default device
- Primary DNS server
- Secondary DNS server

### 3.2.2.1.3 Point-to-Point Protocol over Ethernet (PPPoE)

- Select 'Point-to-point protocol over Ethernet (PPPoE)' from the 'Connection Type' drop-down list (refer to the figure).

**Figure 3-7: Internet Connection - PPPoE**

The screenshot shows a 'Quick Setup' window with a gear icon. It has two main sections: 'Internet Connections' and 'Administrator'. Under 'Internet Connections', there is a 'WAN Ethernet' sub-section. The 'Connection Type:' dropdown menu is set to 'Point-to-Point Protocol over Ethernet (PPPoE)'. Below this are empty text boxes for 'Login User Name (case sensitive):' and 'Login Password:'. The 'Administrator' section has a text box for 'MP202's Hostname:' containing 'MP202' and an empty text box for 'E-Mail:'. At the bottom are three buttons: 'OK' (with a green checkmark), 'Apply' (with a green exclamation mark), and 'Cancel' (with a red X).

Your ISP should provide you with the following information:

- Login user name
- Login password

### 3.2.2.1.4 Point-to-Point Tunneling Protocol (PPTP)

- Select 'Point-to-Point Tunneling Protocol (PPTP)' from the 'Connection Type' drop-down list (refer to the figure).

**Figure 3-8: Internet Connection - Point-to-Point Tunneling Protocol**

The screenshot shows the 'Quick Setup' window with the 'Internet Connections' tab selected. Under 'WAN Ethernet', the 'Connection Type' is set to 'Point-to-Point Tunneling Protocol (PPTP)'. The 'PPTP Server Host Name or IP Address' field is empty. The 'Login User Name (case sensitive)' and 'Login Password' fields are also empty. The 'Internet Protocol' is set to 'Obtain an IP Address Automatically'. In the 'Administrator' section, the 'MP202's Hostname' is 'MP202' and the 'E-Mail' field is empty. At the bottom are 'OK', 'Apply', and 'Cancel' buttons.

Your ISP should provide you with the following information:

- PPTP Server Host Name or IP Address
- Login user name
- Login password

### 3.2.2.1.5 Layer 2 Tunneling Protocol (L2TP)

- Select 'Layer 2 Tunneling Protocol (L2TP)' from the 'Connection Type' drop-down list (refer to the figure).

**Figure 3-9: Layer 2 Tunneling Protocol**

The screenshot shows the 'Quick Setup' window with the 'Internet Connections' tab selected. Under 'WAN Ethernet', the 'Connection Type' is set to 'Layer 2 Tunneling Protocol (L2TP)'. The 'L2TP Server Host Name or IP Address' field is empty. The 'Login User Name (case sensitive)' and 'Login Password' fields are also empty. The 'Internet Protocol' is set to 'Obtain an IP Address Automatically'. In the 'Administrator' section, the 'MP202's Hostname' is 'MP202' and the 'E-Mail' field is empty. At the bottom are 'OK', 'Apply', and 'Cancel' buttons.

Your ISP should provide you with the following information:

- L2TP Server Host Name or IP Address
- Login user name
- Login password

#### 3.2.2.1.6 No Internet Connection

- Select 'No Internet Connection' from the 'Connection Type' combo-box (refer to the figure). Choose this connection type if you do not have an Internet connection, or if you want to disable all existing connections.

**Figure 3-10: Internet Connection - No Internet Connection**

The screenshot shows a 'Quick Setup' window with a gear icon. It has two main sections: 'Internet Connections' and 'Administrator'. Under 'Internet Connections', there is a 'WAN Ethernet' tab and a 'Connection Type' dropdown menu currently set to 'No Internet Connection'. Under the 'Administrator' section, 'MP202's Hostname' is set to 'MP202' and the 'E-Mail' field is empty. At the bottom are three buttons: 'OK' (with a green checkmark), 'Apply' (with a green exclamation mark), and 'Cancel' (with a red X).

## 4 Using the MP-202's Web Interface

### 4.1 Your Home Network Map

When you log into the Web-based management, you'll view the Network Map.

**Figure 4-1: Network Map**

The network map depicts the various network elements from top going down:

1. External network interface (Internet connection)
2. Firewall
3. MP-202
4. Telephones connected to the MP-202
5. Local network computers and peripherals (the figure above shows a network element that obtained its IP address automatically via MP-202's DHCP server).

The table below explains the meaning of different network map symbols:

**Table 4-1: Network Map Symbols**

|                                                                                   |                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Represents the Internet                                                                                                                                                                                |
|  | Represents your Ethernet Wide Area Network (WAN) connection. Click this icon to configure the WAN interface.                                                                                           |
|  | Represents the Telephone Adapter's Firewall. The height of the wall corresponds to the security level currently selected: Minimum, Typical or Maximum. Click this icon to configure security settings. |

If the MP-202 is equipped with multiple LAN devices (other than bridges) then the home network will use the following icons to indicate the interface used for connecting the PC.

**Table 4-2: Icons to Indicate the Interface Used for Connecting the PC**

|                                                                                    |                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Represents an Ethernet Local Area Network (LAN) connection. Click this icon to configure network parameters for the Ethernet LAN device.                                                                                                                    |
|   | Represents a bridge connected in the home network. Click this icon to view the bridge's underlying devices.                                                                                                                                                 |
|  | Represents a computer (host) connected in the home network. Each computer connected to the network appears below the network symbol of the network through which it is connected. Click an icon to view network information for the corresponding computer. |

**Figure 4-2: Host Information**

| Host Information                     |                                                  |
|--------------------------------------|--------------------------------------------------|
| Host:                                | Laptop                                           |
| IP Address:                          | 192.168.2.2                                      |
| Subnet Mask:                         | 255.255.255.0                                    |
| Network Connection:                  | Ethernet                                         |
| Lease Type:                          | Dynamic                                          |
| Port Forwarding Services:            | None                                             |
| Ping Test:                           | <input type="button" value="Test Connectivity"/> |
| Windows Shared Folders:              | \\Eitan-Laptop.home\                             |
| <input type="button" value="Close"/> |                                                  |

## 4.2 Managing Tables

Tables are structures used throughout the Web-based Management. They handle user-defined entries relating to elements such as network connections, local servers, restrictions and configurable parameters. The principles outlined in this section apply to all tables in the Web-based Management.

**Figure 4-3: Typical Table Structure**

| Name              | Status    | Action                                                                              |
|-------------------|-----------|-------------------------------------------------------------------------------------|
| WAN Ethernet      | Up        |  |
| LAN Ethernet      | Connected |  |
| Connection Wizard |           |  |

Close Status Advanced >>

The figure illustrates a typical table. Each row denotes an entry in the table. The following buttons located in the 'Action' column enable adding, editing and deleting table entries:

**Table 4-3: Managing Tables**

|                                                                                     |                                                       |
|-------------------------------------------------------------------------------------|-------------------------------------------------------|
|  | Use the Add button to add a row to the table.         |
|  | Use the Edit button to edit a row from the table.     |
|  | Use the Delete button to remove a row from the table. |

In many tables, the last row includes a button that allows adding a new row to the table.

## 5 Configuring VoIP Parameters

### 5.1 Voice over IP Screen

Open the 'Voice over IP' screen by clicking the button 'Voice over IP' on the menu bar to the left; the Voice over IP' screen opens showing the tabs that allow:

- 'Configuring Signaling Protocol Parameters' on page [32](#)
- 'Configuring Dialing Parameters' on page [37](#)
- 'Configuring Media Streaming Parameters' on page [39](#)
- 'Configuring Voice and Fax Parameters' on page [42](#)
- 'Configuring Services Parameters' on page [43](#)
- 'Configuring Line Settings Screen' on page [46](#)
- 'Configuring Speed Dial Settings' on page [47](#)

**Note:** Clicking the button 'Advanced' in the Voice over IP screens enables configuration of advanced VoIP parameters.

## 5.1.1 Configuring Signaling Protocol Parameters

**Note:** In the current version release, only SIP (Session Initiation Protocol) is supported.

➤ **To configure signaling protocol parameters:**

- After clicking the menu 'Voice over IP' in the main screen, the 'Signaling Protocol' screen opens by default (refer to the figure below).

**Figure 5-1: VoIP - Signaling Protocol**

**Voice Over IP**

**Signaling Protocol**

Signaling Protocol: SIP

**SIP Proxy and Registrar**

☒ Use SIP Proxy

Proxy IP Address or Host Name: 10.16.2.44

Proxy Port: 5060

☒ Use SIP Proxy IP and Port for Registration

Register Expires: 3600 Seconds

☐ Use SIP Outbound Proxy

**Table 5-1: VoIP - Signaling Protocol**

| Parameter                     | Description                                                                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use SIP Proxy</b>          | When checked, outgoing calls will be routed to the configured SIP proxy. If the parameter 'Use SIP Proxy IP and Port for Registration' is checked as well, the configured SIP proxy will also be used as the registrar, allowing incoming calls. |
| <b>Use SIP Registrar</b>      | Check to use a separate SIP registrar server. Default is unchecked.                                                                                                                                                                              |
| <b>Use SIP Outbound Proxy</b> | Use an outbound SIP proxy (all SIP messages will be sent to this server as the first hop). Default is unchecked.                                                                                                                                 |

- Check the checkbox 'Use SIP Proxy'; the 'SIP Proxy' screen (showing basic parameters) opens. Click the button 'Advanced>>'; the 'SIP Proxy' screen (showing

the advanced parameters, including the basic parameters) opens.

**Figure 5-2: VoIP - Signaling Protocol - SIP Proxy and Registrar**

The screenshot displays the 'Voice Over IP' configuration window. At the top, there is a navigation bar with tabs: 'Signaling Protocol', 'Dialing', 'Media Streaming', 'Voice and Fax', 'Services', 'Line Settings', and 'Speed Dial'. The 'Signaling Protocol' tab is selected. Below the tabs, the 'Signaling Protocol' section is visible, with 'SIP' selected for the 'Signaling Protocol' field. The 'SIP Transport Protocol' is set to 'UDP', and the 'Local SIP Port' is '5060'. The 'Gateway Name - User Domain' field is empty. Below this, the 'SIP Proxy and Registrar' section is shown. The 'Use SIP Proxy' checkbox is checked. The 'Proxy IP Address or Host Name' is '10.16.2.44', and the 'Proxy Port' is '5060'. The 'Use SIP Proxy IP and Port for Registration' checkbox is also checked. The 'Register Expires' field is set to '3600' seconds. The 'Use SIP Outbound Proxy' checkbox is unchecked. Below this, the 'SIP Timers' section is visible. The 'Retransmission Timer T1' is '500' milliseconds, 'Retransmission Timer T2' is '4000' milliseconds, 'Retransmission Timer T4' is '5000' milliseconds, and the 'INVITE Timer' is '32000' milliseconds. At the bottom of the window, there are four buttons: 'OK', 'Apply', 'Cancel', and 'Basic <<'. The 'Basic <<' button is highlighted.

| Signaling Protocol          |      |
|-----------------------------|------|
| Signaling Protocol:         | SIP  |
| SIP Transport Protocol:     | UDP  |
| Local SIP Port:             | 5060 |
| Gateway Name - User Domain: |      |

| SIP Proxy and Registrar                                                        |              |
|--------------------------------------------------------------------------------|--------------|
| <input checked="" type="checkbox"/> Use SIP Proxy                              |              |
| Proxy IP Address or Host Name:                                                 | 10.16.2.44   |
| Proxy Port:                                                                    | 5060         |
| <input checked="" type="checkbox"/> Use SIP Proxy IP and Port for Registration |              |
| Register Expires:                                                              | 3600 Seconds |
| <input type="checkbox"/> Use SIP Outbound Proxy                                |              |

| SIP Timers               |                    |
|--------------------------|--------------------|
| Retransmission Timer T1: | 500 milliseconds   |
| Retransmission Timer T2: | 4000 milliseconds  |
| Retransmission Timer T4: | 5000 milliseconds  |
| INVITE Timer:            | 32000 milliseconds |

OK Apply Cancel Basic <<

**Table 5-2: VoIP - Signaling Protocol - SIP Proxy and Registrar**

| Parameter                                         | Description                                                                                                                                                                                                                                      |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SIP Transport Protocol*</b>                    | Choose either UDP (default) or TCP.                                                                                                                                                                                                              |
| <b>Local SIP Port*</b>                            | The UDP/TCP port (default = 5060) on which the Stack listens.                                                                                                                                                                                    |
| <b>Gateway Name-User Domain*</b>                  | This domain name will be sent in the From header of outgoing Invite messages.                                                                                                                                                                    |
| <b>Use SIP Proxy</b>                              | When checked, outgoing calls will be routed to the configured SIP proxy. If the parameter 'Use SIP Proxy IP and Port for Registration' is checked as well, the configured SIP proxy will also be used as the registrar, allowing incoming calls. |
| <b>Proxy IP Address or Host Name</b>              | The IP address or host name of the SIP proxy.                                                                                                                                                                                                    |
| <b>Proxy Port</b>                                 | The UDP or TCP port of the SIP proxy.                                                                                                                                                                                                            |
| <b>Use SIP Proxy IP and Port for Registration</b> | Use the SIP proxy IP and port for registration. Default = checked. When checked, there is no need to configure the address of the registrar separately.                                                                                          |
| <b>Use SIP Outbound Proxy</b>                     | Use an outbound SIP proxy (all SIP messages will be sent to this server as the first hop). Default = unchecked.                                                                                                                                  |

\* This parameter appears only in 'Advanced' mode.

**Table 5-3: VoIP - Signaling Protocol - SIP Timers**

| Parameter                      | Description                                           |
|--------------------------------|-------------------------------------------------------|
| <b>Retransmission Timer T1</b> | The SIP T1 retransmission timer according to RFC 3261 |
| <b>Retransmission Timer T2</b> | The SIP T2 retransmission timer according to RFC 3261 |
| <b>Retransmission Timer T4</b> | The SIP T4 retransmission timer according to RFC 3261 |
| <b>INVITE Timer</b>            | The SIP INVITE timer according to RFC 3261            |

- Uncheck the box 'Use SIP Proxy IP and Port for Registration' and check 'Use SIP Registrar'; the parameters screen for 'SIP Registrar' opens (showing the basic parameters). Click the button 'Advanced'; the parameters screen for 'SIP Registrar' (showing the advanced parameters, including the basic parameters) opens.

**Figure 5-3: VoIP - Signaling Protocol - SIP Proxy and Registrar**

The screenshot shows the 'Voice Over IP' configuration window. At the top, there is a tabbed interface with 'Signaling Protocol' selected. Below the tabs, the 'Signaling Protocol' section shows 'SIP' selected. The 'SIP Proxy and Registrar' section contains the following settings:

- ☒ Use SIP Proxy
- Proxy IP Address or Host Name: 10.16.2.44
- Proxy Port: 5060
- ☐ Use SIP Proxy IP and Port for Registration
- ☒ Use SIP Registrar
- Registrar Address: 0.0.0.0
- Registrar Port: 5060
- Register Expires: 3600 Seconds
- ☐ Use SIP Outbound Proxy

At the bottom, there are four buttons: 'OK', 'Apply', 'Cancel', and 'Advanced >>'.

The table below shows descriptions of those SIP Registrar parameters that differ from SIP Proxy parameters. Descriptions of common parameters can be seen under the section 'SIP Proxy and Registrar', above.

**Table 5-4: VoIP - Signaling Protocol - SIP Registrar SIP**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <b>Use SIP Registrar</b> | Check the box to use a separate SIP registrar server. |
| <b>Registrar Address</b> | The IP address or host name of the registrar server.  |
| <b>Registrar Port</b>    | The UDP or TCP port of the registrar server.          |
| <b>Registrar Expires</b> | The registration timeout, in seconds.                 |

Check the box 'Use SIP Outbound Proxy'; the parameters screen for 'SIP Outbound Proxy' opens (showing the basic parameters). Click the button 'Advanced'; the parameters screen for 'SIP Outbound Proxy' (showing the advanced parameters, including the basic parameters) opens.

**Figure 5-4: VoIP - Signaling Protocol - SIP Outbound Proxy**

 Voice Over IP

**Signaling Protocol**

Signaling Protocol: SIP

**SIP Proxy and Registrar**

☒ Use SIP Proxy

**Table 5-7: VoIP - Dialing Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dialing Timeout</b>     | Dialing timeout specifies the duration (in seconds) of allowed inactivity between dialed digits. When you work with a proxy or gatekeeper, the number you have dialed before the dialing process has timed out is sent to the proxy/gatekeeper as the user ID to be called. This is useful for calling a remote party without creating a speed dial entry (assuming the remote party is registered with the proxy/gatekeeper).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Phone Number Size</b>   | The maximum length of shortcut numbers that you can enter and the maximum number of digits that you can dial.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Dial Tone Timeout</b>   | The duration of the dial tone, in seconds. If the limit is exceeded, the dial tone will stop and you will hear a warning tone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>DTMF Transport Mode</b> | DTMFs are the tones generated by your telephone's keypad. Choose either Inband, RFC 2833, or Via SIP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Digit Map</b>           | <p>Enables the ISP to predefine possible formats (or patterns) for the dialed number. A match to one of the defined patterns terminates the dialed number. An 'x' in the pattern indicates any digit. ';' separates between patterns.</p> <p>Example: '10x;05xxxxxxx;4xxx'.</p> <p>In this example, 3 patterns are defined. A number that starts with 10 will be terminated after the 3rd digit and so on. If the user dials a number that does not match any pattern, the number will be terminated using the timeout or when the user presses the pound ('#') key.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Dial Plan</b>           | <p>This parameter works in conjunction with the Digit Map and enables translation of specific patterns to specific SIP destination addresses. An 'x' represents any dialed digit. Each backslash at the right side of the '=' represents one of the dialed digits.</p> <p>Example: '4xxx=Line_\\@10.1.2.3'</p> <p>This rule will issue a call to 10.1.2.3 with the SIP ID of Line_ followed by the last 3 digits of the dialed number.</p> <p>Rules are separated by the character';'</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Key Sequence</b>        | <p>Choose either 'Flash only' (default) or 'Flash + digits sequence'.</p> <p>'Flash only' uses only the phone's Flash button. There are 3 scenarios:</p> <p>(1) During an existing call, if the user presses Flash, the call is put on hold; a dial tone is heard and the user is able to initiate a second call. Once the second call is established, on-hooking transfers the first (held) call to the second call.</p> <p>(2) During an existing call, if the user presses Flash, the call is put on hold and a dial tone is heard. The user can initiate a second call and establish a 3-way conference by again pressing Flash after the second call is initiated.</p> <p>(3) During an existing call, if a call comes in (call waiting), pressing Flash puts the active call on hold and answers the waiting call; pressing Flash again toggles between these two calls.</p> <p>'Flash + digits sequence' is where a sequence of Flash + 1 holds a call or toggles between two existing calls. Flash + 2 makes a call transfer. Flash + 3 establishes a 3-way conference.</p> |

### 5.1.3 Configuring Media Streaming Parameters

➤ **To configure Media Streaming parameters:**

- Click tab 'Media Streaming'; the 'Media Streaming' screen opens.

**Figure 5-5: VoIP - Media Streaming - Basic**

| Parameter                                                           | Description                                                                              |
|---------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| <b>RTP Port Range - Contiguous Series of 8 Ports Starting From:</b> | Defines the port range for Real Time Protocol (RTP) voice transport.                     |
| <b>DTMF Relay RFC 2833 Payload Type</b>                             | The RTP payload type used for RFC 2833 DTMF relay packets. Range = 0-255. Default = 101. |
| <b>G.726/16 Payload Type</b>                                        | The RTP payload type used for 16 kbps G.726 packets. Range = 0-255. Default = 98.        |

**Table 5-10: VoIP - Advanced - Quality of Service Parameters**

| Parameter                                     | Description                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type of Service (Hex)</b>                  | This is a part of the IP header that defines the type of routing service to be used to tag outgoing voice packets, originated from the MP-202. It is used to tell routers along the way that this packet should get specific QoS. Leave this value as 0xb8 (default) if you are unfamiliar with the Differentiated Services IP protocol parameter.  |
| <b>Use MSS Clamping to Reduce Voice Delay</b> | When using Maximum Segment Size (MSS) Clamping, TCP streams routed via the MP-202 when a voice call is active, will have a smaller segment size. This will cause RTP to receive a better priority and will help prevent high voice jitter that results of slow upstream transmission rate, as common with most WAN connections (DSL, DOCSIS, etc.). |

### 5.1.3.1 Configuring Codecs

Codecs define the method of relaying voice data. Different codecs have different characteristics, such as data compression and voice quality. For example, G.723 is a codec that uses compression, so it is good for use where bandwidth is limited but its voice quality is not as good compared to other codecs such as the G.711.

### 5.1.3.2 Supported Codecs

To make a call, at least one codec must be enabled. Moreover, all codecs may be enabled for best performance. When you start a call to a remote party, your available codecs are compared against the remote party's, to determine which codec will be used. The priority by which the codecs are compared is according to the descending order of their list, depicted in the figure above. To change the priorities, rearrange the codecs in the required order.

If there is no codec that both parties have made available, the call attempt will fail. Note that if more than one codec is common to both parties, you cannot force which of the common codecs that were found will be used by the remote party's client. If you do wish to force the use of a specific codec, leave only that codec checked.

### 5.1.3.3 Packetization Time

The Packetization Time is the length of the digital voice segment that each packet holds. The default is 20 millisecond packets. Selecting 10 millisecond packets reduces the delay but increases the bandwidth consumption.

## 5.1.4 Configuring Voice and Fax Parameters

### ➤ To configure Voice and Fax parameters:

- Click the tab 'Voice and Fax'; the basic 'Voice and Fax' parameters screen opens.
- Click the button 'Advanced'; the extended 'Voice and Fax' parameters screen opens.

**Table 5-11: VoIP - Voice and Fax**

| Parameter                                        | Description                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line 1 Voice Volume / Line 2 Voice Volume</b> | The voice volume of line 1 / 2 (the gain from the network towards the local phone). Default = 0 dB.                                                                                                                                                                                                                                                                          |
| <b>Enable Automatic Gain Control</b>             | When enabled (when the box is checked), the device will adjust the voice volume automatically to compensate for a weak or loud signal.                                                                                                                                                                                                                                       |
| <b>Minimum Delay</b>                             | The initial and minimal delay of the adaptive jitter buffer mechanism, which compensates for network problems. The value should be set according to the expected average jitter in the network (in milliseconds). Default = 35 msec.                                                                                                                                         |
| <b>Optimization Factor</b>                       | The adaptation rate of the jitter buffer mechanism. Higher values will cause the jitter buffer to respond faster to increased network jitter. Default = 7.                                                                                                                                                                                                                   |
| <b>Enable Silence Compression</b>                | Check to enable silence compression for reducing the network bandwidth consumption. Default = Disabled.                                                                                                                                                                                                                                                                      |
| <b>Enable Echo Cancellation</b>                  | Check to enable echo cancellation (disabling echo cancellation should be done for testing purposes only). Default = Enabled.                                                                                                                                                                                                                                                 |
| <b>Fax Transport Mode</b>                        | Selects the way fax calls are handled:<br><br>Transparent = Fax is transferred in-band (like a voice call) (can be used if the codec is G.711)<br>T.38 Relay = Fax is relayed to the remote side according to the T.38 standard<br>VBD = (Voice Band Data) Switch to G.711 via SIP messaging<br>Bypass = An automatic switch to Nuera's proprietary payload type (102, 103). |
| <b>Fax Bypass Coder</b>                          | Select the codec to be used for the VBD and Bypass modes. PCMA (default) or PCMU.<br>G.711 64 kbps A-Law<br>-OR-<br>G.711 64 kbps u-Law                                                                                                                                                                                                                                      |
| <b>Enable CNG Detection</b>                      | Check to enable detection of the fax CNG signal (generated by the calling fax machine at the beginning of the fax session). Default = Disabled.                                                                                                                                                                                                                              |
| <b>Max Rate</b>                                  | The maximum fax rate. Select from the drop-down list either: 2.4 Kbps, 4.8 Kbps, 7.2 Kbps, 9.6 Kbps, 12 Kbps or 14.4 Kbps (default).                                                                                                                                                                                                                                         |
| <b>Error Correction Mode</b>                     | Check to enable fax error correction mode (ECM). Default = Enabled.                                                                                                                                                                                                                                                                                                          |

### 5.1.5 Configuring Services Parameters

➤ **To configure Service parameters:**

- Click the tab 'Service'; the basic 'Service' parameters screen opens.

- Click the button 'Advanced'; the extended 'Service' parameters screen opens.

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Waiting                       | Call Waiting SIP Reply - which response message is sent when another call arrives while a call is in progress. There are two possibilities: 180 Ringing or 182 Queued (default). To disable the call waiting feature, select 180 Ringing.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Call Forward Type                  | <p>The Call Forward feature permits a user to redirect incoming calls addressed to him/her to another number. The user's ability to originate calls is unaffected by Call Forward. Three types of Call Forwarding exist:</p> <ul style="list-style-type: none"> <li>▪ Unconditional. When selected, incoming calls are forwarded independently of the status of the endpoint.</li> <li>▪ Busy. When selected, incoming calls are forwarded only if the endpoint is busy, i.e., if all lines are active.</li> <li>▪ No Reply. When selected, incoming calls are forwarded only if the endpoint does not answer before a pre-configured timeout (see next parameter).</li> </ul> |
| Time for No Reply Forward          | If you specify 5 seconds for this parameter, for example, and 'No Reply' is selected for parameter 'Call Forward Type' (see above), incoming calls are forwarded only after 5 seconds lapse.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Key Sequence                       | The default is *72 but users can modify to any sequence of up to 2 digits, i.e., *n or *nm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Message Waiting Indication         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Subscribe to MWI                   | Check this checkbox if you must register with a MWI subscriber server. If so, configure the three parameters below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| MWI Server IP Address or Host Name | The IP address or host name of the MWI server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MWI Server Port                    | The port number of the MWI server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MWI Subscribe Expiration Time      | The interval between registrations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Stutter Tone Duration              | When you enable message waiting and an unheard message exists, you'll hear a stutter tone for the duration configured in this parameter and/or when you activate the call forwarding feature (refer to 'Forwarding Calls to Another Phone' on page 55).                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 5.1.6 Configuring Line Settings Screen

Before starting to make phone calls, configure each line's parameters.

1. Click the tab 'Line Settings'; the screen that opens (refer to the figure) enables you to define the phone ports of the MP-202 and to configure them.

**Figure 5-10: VoIP - Line Settings**

| Line                                  | User ID | Display Name | Action                                                                              |
|---------------------------------------|---------|--------------|-------------------------------------------------------------------------------------|
| <input checked="" type="checkbox"/> 1 | 203     | Line 203     |  |
| <input type="checkbox"/> 2            | 205     | Line 205     |  |

OK Apply Cancel

2. Click the 'Action' icon in each line to configure the line's different parameters (refer to the figure).

**Figure 5-11: VoIP - Line Settings - Defining a New Line**

Authentication Password:

OK Cancel

**Table 5-13: VoIP - Line Settings**

| Parameter                       | Description                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line Number</b>              | A telephone port in the MP-202 to which you can connect a standard (POTS) telephone. You can manage which telephone is operational by checking the check-box adjacent to it. |
| <b>User ID</b>                  | This telephone's VoIP user ID, used for identification to initiate and accept calls.                                                                                         |
| <b>Block Caller ID</b>          | Check this check box to hide your ID from the remote party.                                                                                                                  |
| <b>Display Name</b>             | Used to define a name to intuitively identify the line. A free text description to be displayed to remote parties as your caller ID.                                         |
| <b>Authentication User Name</b> | The user name received from the VoIP Service Provider. Used when sending a response to Unauthorized or Proxy Authentication Requested (401/407).                             |
| <b>Authentication Password</b>  | The password received from the VoIP Service Provider. Used when sending a response to Unauthorized or Proxy Authentication Requested (401/407).                              |

### 5.1.7 Configuring Speed Dial Settings

Use the 'Speed Dial Settings' screen to associate a called party's contact parameters (including the IP address of his/her ATA and Line ID) with a number that you'll dial to call him/her. The number of speed-dialing codes that can be defined is unlimited. Use the screen to define a destination type: Proxy, Local Line or Direct Call.

Note that when connecting the MP-202 to a World-Wide SIP Server (refer to 'Connecting MP-202's VoIP to a VoIP Service Provider' on page 51), you don't need to configure 'Speed Dial Settings'.

➤ **To configure 'Speed Dial' settings:**

1. Click tab 'Speed Dial'; the 'Speed Dial' screen opens.

**Figure 5-12: VoIP - Speed Dial**

Voice Over IP

| Speed Dial | User ID | IP Address or Host Name | Port | Action |
|------------|---------|-------------------------|------|--------|
| New Entry  |         |                         |      |        |

Close

Click 'New Entry' to add a new speed dial entry; the 'Speed Dial Settings' screen appears. The figure below shows how a proxy speed dial is configured. The proxy IP address is 'Office' and number to speed-dial is 123.

**Figure 5-13: VoIP - Speed Dial Settings**

The dialog box titled "Speed Dial Settings" contains three input fields: "Speed Dial:" with the value "123", "Destination:" with a dropdown menu set to "Proxy", and "User ID:" with the value "Office". At the bottom are "OK" and "Cancel" buttons.

**Table 5-14: 'Speed Dial Settings' - via Proxy**

| Parameter          | Description                                                   |
|--------------------|---------------------------------------------------------------|
| <b>Speed Dial</b>  | Defines the number to dial.                                   |
| <b>Destination</b> | Defines the entry's destination, in this case a proxy server. |
| <b>User ID</b>     | Defines the user ID to call.                                  |

The figure below shows how a local line speed dial is configured from port 'Line 2' on the MP-202 to port 'Line 1' on the MP-202. The speed dial number 225 is now associated with Line 1 on the MP-202.

**Figure 5-14: VoIP - Speed Dial - Local Line**

The dialog box titled "Speed Dial Settings" contains three input fields: "Speed Dial:" with the value "225", "Destination:" with a dropdown menu set to "Local Line", and "Line:" with a dropdown menu set to "0000000001 (Line 1)". At the bottom are "OK" and "Cancel" buttons.

- Click 'OK'; you're returned to the Voice Over IP' screen displaying the configured speed dial (refer to the figure below, displaying how two local lines are configured for speed dial).

Figure 5-15: VoIP - Speed Dial Settings - Local Line

Voice Over IP

Signaling Protocol   Dialing   Media Streaming   Voice and Fax   Services   Line Settings   **Speed Dial**

| Speed Dial | User ID             | IP Address or Host Name | Port | Action |
|------------|---------------------|-------------------------|------|--------|
| 225        | 0000000001 (Line 1) | Local Line              | -    |        |
| 226        | 0000000002 (Line 2) | Local Line              | -    |        |
| New Entry  |                     |                         |      |        |

Table 5-15: 'Speed Dial Settings' - Direct Call

| Parameter                      | Description                                               |
|--------------------------------|-----------------------------------------------------------|
| <b>Speed Dial</b>              | A shortcut number which you will dial to call this party. |
| <b>Destination</b>             | The entry's destination, in this case a direct call.      |
| <b>User ID</b>                 | Specify the remote party's user ID.                       |
| <b>IP Address or Host Name</b> | Specify the remote party's IP Address or host name.       |
| <b>Port</b>                    | The SIP UDP or TCP port of the remote party.              |

## 6 Connecting the MP-202 to a VoIP Service Provider

Using the MP-202's VoIP capabilities, it is possible to connect to a remote SIP server in order to conduct worldwide phone calls.

The following section describes how to place a worldwide phone call utilizing the MP-202's VoIP capabilities over a SIP server. Verify that your Telephone Adapter and telephone are correctly connected and that your WAN connection is up.

### 6.1 Opening a SIP Account

Before you can connect to a SIP server, it is necessary that you obtain a SIP account. The following section describes how to open a free worldwide dialing SIP account. You can also obtain a paid SIP account.

- **To open a free worldwide dialing SIP account on the Pulver.com Free World Dialup service:**
  - Browse to 'http://www.pulver.com/fwd' http://www.pulver.com/fwd and open a new account.

### 6.2 Configuring VoIP Parameters

**Note:** This section describes the minimal set of changes required to connect to a VoIP Service Provider. Other configuration changes might be required to connect to some Service Providers.

- **To configure VoIP parameters:**
  1. Click the icon 'Voice Over IP' on the toolbar on the left side of the page; the 'Voice Over IP' configuration screen opens.
  2. Click tab 'Line Settings'. If you only have a single number, disable line 2 by unchecking the '2' checkbox and click 'Apply'.

**Figure 6-1: VoIP - Line Settings**

| Line                                  | User ID | Display Name | Action |
|---------------------------------------|---------|--------------|--------|
| <input checked="" type="checkbox"/> 1 | 203     | Line 203     |        |
| <input type="checkbox"/> 2            | 205     | Line 205     |        |

3. Click the 'Action' icon on the right of line 1; the 'Line Settings' screen opens (refer to the figure). Use the configuration values provided by your ISP to configure the parameters in this screen.

**Figure 6-2: VoIP - Line Settings - Defining a New Line**

 **Line Settings**

|                                          |      |
|------------------------------------------|------|
| Line Number:                             | 1    |
| User ID:                                 | 200  |
| <input type="checkbox"/> Block Caller ID |      |
| Display Name:                            | Alan |

**SIP Proxy**

|                           |  |
|---------------------------|--|
| Authentication User Name: |  |
| Authentication Password:  |  |

4. Click tab 'Signaling Protocol' and check the box 'Use SIP Proxy' (refer to 'Configuring Signaling Protocol Parameters' on page 32)
5. Define the field 'Proxy IP Address or Host Name' of the ISP's SIP proxy, provided by the ISP (refer to 'Configuring Signaling Protocol Parameters' on page 32)
6. Press 'OK' or 'Apply' to complete the VoIP configuration.

**Note:** Check that the gateway was successfully registered by clicking 'System Monitoring' > tab 'Voice over IP'; entry 'SIP Registration' should indicate 'Registered' for the line(s) you configured. Phone 1 and Phone 2 LEDs should be flashing slowly.

- Pick up the phone receiver and listen for the dial tone; you're now ready to place an outgoing call.
- All your settings are saved in the gateway's non-volatile memory. From now on, you won't need the PC to make VoIP calls.

## 7 Making VoIP Calls

Users connected to the MP-202 can place calls, put calls on hold, transfer calls and manage 3-way conferences. The following describes how to perform these operations.

### 7.1 Placing a Call

➤ **To place a call, take these steps:**

1. Pick up the phone.
2. Make sure that you can hear a dial tone
3. Dial the remote party's number or pre-configured speed dial number.

### 7.2 Answering a Waiting Call

➤ **To answer a waiting call when 'Flash only' is configured (refer to 'Configuring Dialing Parameters' on page 37):**

1. When you hear a call waiting tone (during a call), press 'Flash' on the phone; this puts the active call on hold and switches to the waiting call.
2. To return to the original call, press Flash again. You can toggle from one party to another as much as you like by pressing Flash.

➤ **To answer a waiting call when 'Flash + digits sequence' is configured (refer to 'Configuring Dialing Parameters' on page 37):**

1. When you hear the call waiting tone (during a call), press the 'Flash' key on the phone and then the '1' key; this puts the original call on hold and switches to the waiting call.
2. To return to the original call, press Flash+1 again. You can toggle from one party to another as much as you like by pressing Flash+1.

### 7.3 Putting a Call on Hold

➤ **To place the remote party on hold when 'Flash only' is configured (refer to 'Configuring Dialing Parameters' on page 37):**

1. During a call, press 'Flash' on the phone; the phone plays a dial tone. At this point you can initiate a second call by dialing another party's number.

**Note:** If you press 'Flash' again before the other party answers, you'll revert to the original call. If, however, the other party answers and you press 'Flash', a 3-way conference is established.

- **To place the remote party on hold when 'Flash + digits sequence' is configured (refer to 'Configuring Dialing Parameters' on page 37):**
  1. Press the 'Flash' key and then the '1' key on the phone; the phone plays a dial tone. At this point you can initiate a second call by dialing another party's number.
  2. To cancel the hold state and resume the previous phone call, press 'Flash' and then '1'.

## 7.4 Performing a Call Transfer

- **To transfer an existing call with (B) to a third party (C) when 'Flash only' is configured (refer to 'Configuring Dialing Parameters' on page 37):**
  1. During a call with party B, press 'Flash'; Party B is placed on hold and you'll hear a dial tone.
  2. Dial party C's number.
  3. You can wait for C to answer or not.
  4. On hook; you've transferred B to C.
- **To transfer an existing call with (B) to a third party (C) when 'Flash + digits sequence' is configured (refer to 'Configuring Dialing Parameters' on page 37):**
  1. During a call with party B, press 'Flash' and then the '1' key on the phone; Party B is placed on hold and you'll hear a dial tone.
  2. Dial party C's number.
  3. You can wait for C to answer or not.
  4. Press the 'Flash' key and then the '2'; you've transferred B to C; a warning tone is heard.

## 7.5 Establishing a 3-Way Conference

- **To extend an existing call with party B into a 3-way conference by bringing in party C when 'Flash only' is configured (refer to 'Configuring Dialing Parameters' on page 37):**
  1. During a call with party B, press 'Flash'; Party B is placed on hold and you'll hear a dial tone.
  2. Dial party C's number and wait until the call is established.

3. Press 'Flash' again to put B and C in a 3-way conference.
  4. To end the 3-way conference call, on-hook. Alternatively, press 'Flash' again.
- **To extend an existing call with party B into a 3-way conference by bringing in party C when 'Flash + digits sequence' is configured (refer to 'Configuring Dialing Parameters' on page 37):**
1. During a call with party B, press 'Flash' and then the '1' key on the phone; Party B is now placed on hold and you'll hear a dial tone.
  2. Dial party C's number and wait until the call is established.
  3. Press 'Flash' and then the '3' key to put B and C in a 3-way conference.
  4. To end the 3-way conference call, on-hook. Alternatively, press 'Flash' and then the '3' key.

## 7.6 Forwarding Calls to Another Phone

- **To forward calls to another phone:**
1. First configure call forwarding (refer to 'Configuring Services Parameters' on page 43)
  2. Pick up the phone.
  3. Make sure that you can hear a dial tone
  4. Dial the call forward key sequence, for example, \*32; you'll hear a dial tone.
  5. Dial the number of the phone to which you want calls forwarded; you'll hear a stutter tone (refer to 'Configuring Services Parameters' on page 43).
  6. Replace the receiver; from now on, all incoming calls will be forwarded. Every time you pick up this receiver you'll hear the stutter tone for the length of time you configured for parameter 'Stutter Tone Duration'.
- **To deactivate calls forwarding:**
1. Pick up the phone; you'll hear a stutter tone.
  2. Dial the call forward key sequence.
  3. Replace the receiver.
  4. To make sure you've de-activated, pick up the phone again; you should hear a regular dial tone and not the stutter tone.

## 8 Quality of Service (QoS)

### 8.1 Traffic Shaping

Traffic Shaping is the solution for managing and avoiding congestion where a high speed LAN meets limited broadband bandwidth. A user may have, for example, a 100 Mbps Ethernet LAN with a 100 Mbps WAN interface router. The router may communicate with the ISP using a modem with a bandwidth of 2Mbps. This typical configuration makes the modem, having no QoS module, the bottleneck. The router sends traffic as fast as it is received, while its well-designed QoS algorithms are left unused. Traffic shaping limits the bandwidth of the router, artificially forcing the router to be the bottleneck.

A traffic shaper is essentially a regulated queue that accepts uneven and/or bursty flows of packets and transmits them in a steady, predictable stream so that the network is not overwhelmed with traffic.

While Traffic Priority allows basic prioritization of packets, Traffic Shaping provides more sophisticated definitions, such as:

- Bandwidth limit for each device
- Bandwidth limit for classes of rules
- Prioritization policy
- TCP serialization on a device

Additionally, you can define QoS traffic shaping rules for a default device. These rules will be used on a device that has no definitions of its own. This enables the definition of QoS rules on Default WAN, for example, and their maintenance even if the PPP or bridge device over the WAN is removed.

#### 8.1.1 Device Traffic Shaping

This section describes the different Traffic Shaping screens and terms, and presents the feature's configuration logic.

1. On the sidebar click the QoS link and then click the tab 'Traffic Shaping'.
2. Click the link 'New Entry'; the screen 'Add Device Traffic Shaping' opens (refer to the figure).

**Figure 8-1: QoS - Add Device Traffic Shaping**

3. From the drop-down list select the device for which to shape traffic. The drop-down list includes all your interfaces as well as category options (e.g., All LAN Devices, All WAN Devices) and VPNs such as PPoE, PPTP and L2TP (if defined). Select, for example, the option 'WAN Ethernet' and click 'OK'; the 'Edit Device Traffic Shaping' screen opens (refer to the figure).

**Figure 8-2: QoS - Edit Device Traffic Shaping**

**Edit Device Traffic Shaping**

**Device:** WAN Ethernet

**Traffic Shaping**

**Tx Bandwidth:**  Kbits/s

**Rx Bandwidth:**  Kbits/s

**TCP Serialization:** Disable

**Shaping Classes**

| Class ID                  | Name | Priority | Tx Bandwidth (Kbits/s) |         | Rx Bandwidth (Kbits/s) |         | Status | Action                                                                              |
|---------------------------|------|----------|------------------------|---------|------------------------|---------|--------|-------------------------------------------------------------------------------------|
|                           |      |          | Reserved               | Maximum | Reserved               | Maximum |        |                                                                                     |
| <a href="#">New Entry</a> |      |          |                        |         |                        |         |        |  |

✓ OK
! Apply
✗ Cancel

4. Configure the following fields:

**Table 8-1: Edit Device Traffic Shaping - Parameter Descriptions**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tx Bandwidth      | This parameter limits the gateway's bandwidth transmission rate. The purpose is to limit the bandwidth of the WAN device to that of the weakest outbound link, for instance, the DSL speed provided by the ISP. This forces the gateway to be the network bottleneck, where sophisticated QoS prioritization can be performed. If the device's bandwidth is not limited correctly, the bottleneck will be in an unknown router or modem on the network path, rendering the gateway QoS useless.                                      |
| Rx Bandwidth      | In the same manner, this parameter limits the gateway's bandwidth reception rate to that of the DSL modem.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TCP Serialization | You can enable TCP Serialization in its combo box, either for active voice calls only or for all traffic. The screen will refresh, adding a 'Maximum Delay' field (refer to the figure). This function allows you to define the maximal allowed transmission time frame (in milliseconds) of a single packet. Any packet that requires a longer time to be transmitted, will be fragmented to smaller sections. This avoids transmission of large, bursty packets that may cause delay or jitter for real-time traffic such as VoIP. |

### 8.1.2 Shaping Classes

The bandwidth of a device can be divided in order to reserve constant portions of bandwidth to predefined traffic types. Such a portion is known as a Shaping Class. When not used by its predefined traffic type, or owner (for example VoIP), the class will be available to all other traffic. However when needed, the entire class is reserved solely for its owner. Moreover, you can limit the maximum bandwidth that a class can use even if the entire bandwidth is available.

When a shaping class is defined for a specific traffic type, two shaping classes are created. The second class is the 'Default Class', responsible for all the packets that do not match the defined shaping class, or any other classes that may be defined on the device. This can be viewed in the Class Statistics screen.

➤ **To add a shaping class:**

1. In the screen 'Edit Device Traffic Shaping', section 'Shaping Classes' (refer to the figure), click the link 'New Entry'; the screen 'Add Class' opens (refer to the figure).

**Figure 8-3: QoS - Edit Device Traffic Shaping - Add Class**

2. Name the new class and click 'OK' to save the settings; the screen 'Edit Device Traffic Shaping' opens.
3. Click the class name to edit the shaping class. Alternatively, click its icon 'Edit' under the column 'Action'; the 'Edit Class' screen opens (refer to the figure).

**Figure 8-4: QoS - Edit Device Traffic Shaping - Edit Class**

| Rule ID        | Source Address | Destination Address | Protocols | Operation | Status | Action    |
|----------------|----------------|---------------------|-----------|-----------|--------|-----------|
| Outbound rules |                |                     |           |           |        | New Entry |
| Inbound rules  |                |                     |           |           |        | New Entry |

Configure the following fields:

**Table 8-2: Edit Class - Parameter Descriptions**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                   |          |                                                                                                                                                                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name           | The name of the class.                                                                                                                                                                                                                                                                                                                                                        |          |                                                                                                                                                                                                                                                                                                                               |
| Class Priority | The class can be granted one of eight priority levels, zero being the highest and seven the lowest.                                                                                                                                                                                                                                                                           |          |                                                                                                                                                                                                                                                                                                                               |
| Tx Bandwidth   | The reserved transmission bandwidth (Committed Information Rate, or CIR) , in kbps, for each class.                                                                                                                                                                                                                                                                           |          |                                                                                                                                                                                                                                                                                                                               |

| Schedule       | By default, the class will always be active. However, you can configure scheduler rules in order to define time segments during which the class may be active.                                                                                                                                                                                                                |          |                                                                                                                                                                                                                                                                                                                               |

### 8.1.2.1 Class Rules

Class rules define which packets belong to the class. They must be defined in order to associate packets that meet them with the shaping class. Without class rules, the shaping class will have no effect whatsoever. Each class can have outbound and/or inbound rules, for outgoing and incoming traffic respectively. For example, you can define that all outgoing packets from computer A in your LAN belong to your VoIP class. These packets will be limited to the class settings (bandwidth, schedule, etc.). In addition, you can define the traffic protocol and priority for each rule (this is not mandatory as in Traffic Priority rules).

#### 8.1.2.1.1 Inbound and Outbound Data

The gateway can control outgoing data easily. It can queue packets, delay them, give precedence to other packets, or drop them. This helps in resolving upload (Tx) traffic bottlenecks and in most cases is sufficient. However, in the case of download (Rx) traffic bottlenecks, the ability to control the flow is much more limited. The gateway cannot queue packets, since in most cases the LAN is much faster than the WAN, and when the gateway receives a packet from the WAN, it passes it immediately to the LAN.

QoS for ingress data has the following limitations, which do not exist for outgoing data:

- QoS can only be applied to TCP streams (UDP streams cannot be delayed).
- No borrowing mechanism.
- When reserving Rx bandwidth, it is strictly taken from the bandwidth of all other classes.

Furthermore, the gateway cannot control the behavior of its WAN gateway (usually the ISP), which may not have proper QoS handling. Unfortunately, this is a common situation. Let's look at a scenario of downloading a large file and surfing the Internet at the same time. Downloading the file is distinguished by small requests, followed by very large responses. This may result in blocking HTML traffic at the ISP. A solution for such a situation is limiting the bandwidth of low-priority TCP connections (such as the file download).

#### ➤ To add a new outbound/inbound class rule:

1. In the screen 'Edit Class' under the screen section 'Class Rules', click link 'New Entry'; the screen 'Add Traffic Priority Rule' opens (refer to the figure).

**Table 8-3: Add Traffic Priority Rule - Parameter Descriptions**

| Parameter                        | Description                                                                                                                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Matching                         | Use the parameters in this screen section to apply a rule. To apply the rule, matching must be performed between IP addresses and/or a traffic protocol must be defined. From the drop-down list choose 'Any', 'User Defined' or the host.                                    |
| Source Address                   | The source address of the packets. From the drop-down list choose 'Any', 'User Defined' or the host.                                                                                                                                                                          |
| Destination Address              | The destination address of the packets. From the drop-down list choose 'Any', 'User Defined' or the host.                                                                                                                                                                     |
| Protocol                         | From the drop-down list, choose a specific protocol, or add a new one by choosing 'User Defined'; the screen 'Edit Service' opens. Click the icon 'new' under the column 'Action'; this commences a sequence that adds a new protocol.                                        |
| QoS Operation                    | In this screen section, set a Quality of Service working method. Check parameter 'Set Priority' or 'Set DSCP' (refer to the descriptions below).                                                                                                                              |
| Set Priority                     | Check this check box to add a priority to the rule. Select priority level 0-7 where 0 = lowest and 7 = highest (each priority level is mapped to low/medium/high priority). This sets the priority of a packet on the connection matching the rule, while routing the packet. |
| Set DSCP                         | Check this check box to mark a DSCP value on packets matching this rule. Enter a value between 0-63 in the field that appears.                                                                                                                                                |
| Log Packets Matched by This Rule | Under the screen section 'Logging', this check box must be checked in order to log the first packet from a connection that was matched by this rule.                                                                                                                          |
| Schedule                         | 'Always' or 'User Defined'. By default, the rule will always be active. However, you can configure scheduler rules in order to define time segments during which the rule may be active.                                                                                      |

**Note:** The hierarchy of the class rules is determined by the order of their addition to the class. For example, if your first rule is 'match packets with any source address, any destination address, and any protocol to this class'; then all packets traveling through the gateway will be associated with the specific class. Any rules defined later will not have any effect.

## 8.2 Traffic Priority

Traffic Priority allows you to manage and avoid traffic congestion by defining inbound and outbound priority rules for each device on your gateway. These rules determine the priority that packets, traveling through the device, will receive. QoS parameters (DSCP marking and packet priority) are set per packet, on an application basis.

You can set QoS parameters using flexible rules, according to the following parameters:

- Source/destination IP address, MAC address or host name
- Device
- Source/destination ports

Limit the rule for specific days and hours; the gateway supports two priority marking methods for packet prioritization:

- DSCP
- 802.1p Priority

The matching of packets by rules is connection-based, known as Stateful Packet Inspection (SPI), using the same connection-tracking mechanism used by firewall. Once a packet matches a rule, all subsequent packets with the same attributes receive the same QoS parameters, both inbound and outbound.

A packet can match more than one rule. Therefore:

- The first class rule has precedence over all other class rules (scanning is stopped once the first rule is reached).
- The first traffic-priority (classless) rule has precedence over all other traffic-priority rules.
- There is no prevention of a traffic-priority rule conflicting with a class rule. In this case, the priority and DSCP setting of the class rule (if given) will take precedence.

Connection-based QoS also allows inheriting QoS parameters by some of the applications that open subsequent connections. For instance, you can define QoS rules on SIP, and the rules will apply to both control and data ports (even if the data ports are unknown). This feature applies to all applications that have ALG at firewall:

- Any
- User Defined (FTP, HTTP, HTTPS, TFTP, IMAP, PING, POP3, SNMP, SMTP, Telnet, L2TP, Traceroute or any other protocol)

➤ **To set traffic priority rules:**

1. Press the QoS button on the sidebar; the Traffic Priority screen (the first tab) appears. This screen is divided into two identical sections, one for 'QoS Input Rules' and the other for 'QoS Output Rules', which are for prioritizing inbound and outbound traffic respectively. Each section lists all the devices on which rules can be set. You can set rules on all devices at once by clicking the link 'New Entry' adjacent to 'All Devices'.

**Table 8-4: Add Traffic Priority Rule - Parameter Descriptions**

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Address                   | The source address of the packets sent to or received from the network object. From the drop-down list choose 'Any', 'User Defined' or the host.                                                                                                                                                                                            |
| Destination Address              | The destination address of the packets sent to or received from the network object. This address can be configured in the same manner as the source address. From the drop-down list choose 'Any', 'User Defined' or the host.                                                                                                              |
| Protocol                         | From the drop-down list, choose a specific traffic protocol, or add a new one by choosing 'User Defined'; the screen 'Edit Service' opens. Click the icon 'new' under the column 'Action'; this commences a sequence that adds a new protocol.                                                                                              |
| QoS Operation                    | In this screen section, set a Quality of Service working method. Check parameter 'Set Priority' or 'Set DSCP' (refer to the descriptions below).                                                                                                                                                                                            |
| Set Priority                     | Check this check box to add a priority to the rule; the screen 'Edit Service' opens, allowing you to select between one of eight priority levels, 0 = lowest and 7 = highest (each priority level is mapped to low/medium/high priority). This sets the priority of a packet on the connection matching the rule, while routing the packet. |
| Set DSCP                         | Check this check box to mark a DSCP value on packets matching this rule; the screen 'Edit Service' opens, allowing you to enter the hexadecimal value of the DSCP.                                                                                                                                                                          |
| Log Packets Matched by This Rule | Under the screen section 'Logging', this check box must be checked in order to log the first packet from a connection that was matched by this rule.                                                                                                                                                                                        |
| Schedule                         | 'Always' or 'User Defined'. By default, the rule will always be active. However, you can configure scheduler rules in order to define time segments during which the rule may be active.                                                                                                                                                    |

- Click 'OK' to save the settings

## 8.3 DSCP Mapping

In order to understand what is Differentiated Services Code Point (DSCP), one must first be familiarized with the Differentiated Services model.

Differentiated Services (Diffserv) is a Class of Service (CoS) model that enhances best-effort Internet services by differentiating traffic by users, service requirements and other criteria. Packets are specifically marked, allowing network nodes to provide different levels of service, as appropriate for voice calls, video playback or other delay-sensitive applications, via priority queuing or bandwidth allocation, or by choosing dedicated routes for specific traffic flows.

Diffserv defines a field in IP packet headers referred to as DSCP. Hosts or routers passing traffic to a Diffserv-enabled network will typically mark each transmitted packet with an appropriate DSCP. The DSCP markings are used by Diffserv network routers to appropriately classify packets and to apply particular queue handling or scheduling behavior.

The gateway provides a table of predefined DSCP values, which are mapped to 802.1p priority marking method. You can edit or delete any of the existing DSCP setting, as well as add new entries.

1. Press the QoS button on the sidebar and then click the DSCP Settings tab. The following screen will appear (refer to the figure).

**Figure 8-8: QoS - DSCP Settings**

| DSCP Value (hex) | 802.1p Priority | Action |
|------------------|-----------------|--------|
| 0x0              | 0 - Low         |        |
| 0x2              | 0 - Low         |        |
| 0x4              | 4 - Medium      |        |
| 0x6              | 4 - Medium      |        |
| 0x8              | 2 - Low         |        |
| 0xA              | 1 - Low         |        |
| 0xC              | 3 - Low         |        |
| 0xE              | 2 - Low         |        |
| 0x10             | 7 - High        |        |
| 0x12             | 6 - High        |        |
| 0x14             | 7 - High        |        |
| 0x16             | 6 - High        |        |
| 0x18             | 5 - Medium      |        |
| 0x1A             | 5 - Medium      |        |
| 0x1C             | 5 - Medium      |        |
| 0x1E             | 5 - Medium      |        |
| 0x2E             | 7 - High        |        |
| New Entry        |                 |        |

Close

2. To edit an existing entry, click its Edit action icon. To add a new entry, click the New Entry link. In both cases, the 'Edit DSCP Settings' screen will appear (refer to the figure).

**Figure 8-9: QoS - Edit DSCP Settings**

3. Configure the following fields:

**Table 8-5: Edit DSCP Settings- Parameter Descriptions**

| Parameter        | Description                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------|
| DSCP Value (hex) | Enter a hexadecimal number that will serve as the DSCP value.                                                  |
| 802.1p Priority  | Select a 802.1p priority level from the combo box (each priority level is mapped to low/medium/high priority). |

- Click 'OK' to save the settings.

Note that the DSCP value overriding the priority of incoming packets with an unassigned value (priority 0, assumed to be a no-priority-set) is '0x0' (refer to the figure). By default, this value is mapped to 802.1p priority level '0 -Low', which means that such packets will receive the lowest priority.

## 8.4 802.1p Mapping

The IEEE 802.1p priority marking method is a standard for prioritizing network traffic at the data link/Mac sub-layer. 802.1p traffic is simply classified and sent to the destination, with no bandwidth reservations established.

The 802.1p header includes a 3-bit prioritization field, which allows packets to be grouped into eight levels of priority. The gateway maps these eight levels to three main priorities: high, medium and low. By default, values six and seven are mapped to high priority, which may be assigned to network-critical traffic. Values four and five are mapped to medium priority, which may be applied to delay-sensitive applications, such as interactive video and voice. Values three to zero are mapped to low priority, which may range from controlled-load applications down to 'loss eligible' traffic. The zero value is normally used for best-effort traffic. It is the default value for traffic with unassigned priority.

- Click the QoS link on the sidebar and then click the tab '802.1p Settings'; the following screen opens:

**Figure 8-10: QoS - 802.1p Settings**

| 802.1p Value | Priority |
|--------------|----------|
| 0            | Low      |
| 1            | Low      |
| 2            | Low      |
| 3            | Low      |
| 4            | Medium   |
| 5            | Medium   |
| 6            | High     |
| 7            | High     |

OK Apply Cancel

- The eight 802.1p values are pre-configured with the three priority levels: high, medium and low. You can change these levels for each of the eight values in their respective combo box.
- Click 'OK' to save the settings.

## 8.5 Class Statistics

The gateway provides you with accurate, real-time information on the traffic moving through your defined device classes. For example, the amount of packets sent, dropped or delayed, are just a few of the parameters that you can monitor per each shaping class.

To view your class statistics, press the QoS button on the sidebar and then click the Class Statistics tab. The following screen will appear (refer to the figure).

**Note:** Class statistics will only be available after defining at least one class (otherwise the screen will not present any information).

**Figure 8-11: QoS - Class Statistics**

## 8.6 Configuring Basic VoIP QoS

The 'Traffic Shaping' feature only ensures priority to calls that are originated *inside* the MP-202. When giving VoIP priority over data, the bottleneck is effectively moved from the Cable / ADSL modem into the MP-202. To give priority to calls from the LAN, you must define a traffic priority rule (for SIP and RTP from the device on the LAN).

This section recommends a minimal QoS configuration that ensures sufficient QoS for VoIP calls when the gateway is connected behind a broadband (cable or DSL) modem with limited uplink bandwidth and the user runs bandwidth-consuming applications on their PC.

Since most modems do not have any priority mechanisms, the Tx bandwidth of the gateway should be limited according to the modem's uplink bandwidth. Since the gateway will automatically give higher priority to VoIP packets (in its internal queues), it is not necessary to define traffic shaping classes.

### ➤ To perform a minimal QoS configuration for VoIP:

1. Click on menu 'QoS' on the left sidebar and then click tab 'Traffic Shaping'; the Quality of Service - Traffic Shaping screen opens.
2. Click 'New Entry' (or the icon under column 'Action'); the screen 'Add Device Traffic Shaping' opens.

3. From the drop-down list adjacent to parameter 'Device', select 'Default WAN Device' (or your PPTP/L2TP connection you have created) and click OK; the screen 'Edit Device Traffic Shaping' opens.
4. Limit the Tx bandwidth (parameter 'Tx Bandwidth') according to your modem's uplink bandwidth.
5. To prevent jitter in outgoing RTP packets, select 'When Active Voice Calls Exist' from the drop-down list adjacent to parameter 'TCP Serialization' and use parameter 'Maximum Delay' to define the maximum allowed delay (e.g. 20 milliseconds). This will cause long TCP packets to be fragmented when there is an active voice call.

Figure 8-12: QoS - Edit Device Traffic Shaping

**Edit Device Traffic Shaping**

7. Click OK again to exit the QoS page and return to the main page.

## 9 WAN Settings

To change the WAN mode from its default connection type (Ethernet) to PPP, choose from the 'Connection Type' drop-down list in the Quick Setup screen. Alternatively, click link 'New Connection' in the 'Network Connections' screen, check the 'Advanced Connection' radio button and then choose the connection type.

### 9.1 WAN Ethernet

WAN Ethernet is the default mode. WAN Ethernet is used to connect the MP-202 to the network either directly or via an external modem.

➤ **To access its properties:**

- Click on the link 'Network Connections' and in the screen 'Network Connections', click link 'WAN Ethernet'; the screen 'WAN Ethernet Properties' opens (refer to the figure).

**Figure 9-1: WAN Ethernet Properties**

| WAN Ethernet Properties  |                              |
|--------------------------|------------------------------|
| Name:                    | WAN Ethernet                 |
| Device Name:             | ixp1                         |
| Status:                  | Connected                    |
| Network:                 | WAN                          |
| Connection Type:         | Ethernet                     |
| MAC Address:             | 14:f0:52:0b:75:16            |
| IP Address:              | 192.168.65.111               |
| Subnet Mask:             | 255.255.255.0                |
| Default Gateway:         | 192.168.65.1                 |
| DNS Server:              | 192.168.65.1<br>192.168.71.1 |
| IP Address Distribution: | Disabled                     |
| Received Packets:        | 128994                       |
| Sent Packets:            | 1476                         |
| Time Span:               | 23:23:56                     |

➤ **To configure the WAN Ethernet connection:**

- Click on the 'Settings' button at the bottom-right of the connection's Properties screen; the screen 'Configure WAN Ethernet' opens:

**Figure 9-2: WAN Ethernet Configuration**

| Configure WAN Ethernet                                          |                                                                     |
|-----------------------------------------------------------------|---------------------------------------------------------------------|

| <b>IP Address Distribution</b>                                  |                                                                     |
| DHCP Relay <a href="#">New IP Address</a>                       |                                                                     |
| <b>Routing</b>                                                  |                                                                     |
| Basic                                                           |                                                                     |
| <b>Internet Connection Firewall</b>                             |                                                                     |
| <input checked="" type="checkbox"/> Enabled                     |                                                                     |
| <b>Additional IP Addresses</b>                                  |                                                                     |
| <a href="#">New IP Address</a>                                  |                                                                     |
| <a href="#">OK</a> <a href="#">Apply</a> <a href="#">Cancel</a> |                                                                     |

### 9.1.1 General

The top part of the screen 'Configure WAN Ethernet' displays general communication parameters. It is recommended not to change the default values in this screen unless you are familiar with the networking concepts they represent. Since your Telephone Adapter is configured to operate with the default values, no parameter modification is necessary. You can configure the following general connection settings:

**Table 9-1: General Connection Settings**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Schedule</b>         | You can configure scheduler rules in order to define time segments during which the connection is active (via Advanced>Scheduler Rules).                                                                                                                                                                                                              |
| <b>Network</b>          | Select whether the parameters you are configuring relate to a LAN/WAN connection, by selecting LAN/WAN from the drop down list.                                                                                                                                                                                                                       |
| <b>Physical Address</b> | The physical address of the network card used for your network. Some cards allow you to change this address.                                                                                                                                                                                                                                          |
| <b>Clone MAC</b>        | Allows you to copy the current MAC address of your PC to the MAC address of this device.                                                                                                                                                                                                                                                              |
| <b>MTU</b>              | MTU is the Maximum Transmission Unit. It species the largest packet size permitted for Internet transmission. In the default setting, Automatic, the Telephone Adapter selects the best MTU for your Internet connection. In case you change to manual, you can enter the largest packet size, you should leave this value in the 1200 to 1500 range. |

### 9.1.2 Internet Protocol Settings

Select one of the following Internet Protocol options from the 'Internet Protocol' drop down menu:

- **No IP Address**
- **Obtain an IP Address Automatically** (Your WAN connection is configured by default to act as a DHCP client. You should keep this configuration in case your service provider supports DHCP, or if you are connecting using a dynamic IP address)
- **Use the Following IP Address**

Note that according to the selection you make in the 'Internet Protocol' drop down menu, the screen will refresh and display relevant configuration settings.

**Figure 9-3: Internet Protocol Settings - No IP Address**

The server that assigns the Telephone Adapter with an IP address, also assigns a subnet mask. You can override the dynamically assigned subnet mask by selecting the 'Override Subnet Mask' and specifying your own mask instead.

You can press the 'Release' button to release the current leased IP address.

Once the address has been released, the button text changes to 'Renew'.

Use the 'Renew' button to renew the leased IP address. Use the Following IP Address Your WAN connection can be configured using a permanent (static) IP address. Your service provider should provide you with this IP address, subnet mask and the default Telephone Adapter IP address.

### 9.1.3 DNS Server

Domain Name System (DNS) is the method by which website or domain names are translated into IP addresses. You can configure the connection to automatically obtain a DNS server address, or specify such an address manually, according to the information provided by your ISP.

To configure the connection to automatically obtain a DNS server address, select 'Obtain DNS Server Address Automatically' from the 'DNS Server' drop down menu.

**Figure 9-4: Obtain DNS Server Address Automatically**

The screenshot shows a configuration window with a tab labeled 'DNS Server'. Below the tab is a dropdown menu that has been opened, and the option 'Obtain DNS Server Address Automatically' is selected.

To manually configure DNS server addresses, select 'Use the Following DNS Server Addresses' from the 'DNS Server' drop down menu (refer to the figure below).

Specify up to two different DNS server address, one primary, another secondary.

**Figure 9-5: DNS Server Settings**

The screenshot shows the same configuration window as Figure 9-4, but now the dropdown menu is set to 'Use the Following DNS Server Addresses'. Below this, there are two rows of input fields: 'Primary DNS Server:' and 'Secondary DNS Server:'. Each row has four small input boxes for the IP address segments (octets).

### 9.1.4 Routing

You can choose to setup your Telephone Adapter to use static or dynamic routing. Dynamic routing automatically adjusts how packets travel on the network, whereas static routing specifies a fixed routing path to neighboring destinations.

**Table 9-2: Static or Dynamic Routing Parameters**

| Parameter           | Description                                |                                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Routing</b>      | Select 'Advanced' or 'Basic' routing.      |                                                                                                                                                                                                                                                                                                                        |
| <b>Routing Mode</b> | Select one of the following Routing modes: |                                                                                                                                                                                                                                                                                                                        |
|                     | <b>Route</b>                               | Use route mode if you want your Telephone Adapter to function as a router between two networks.                                                                                                                                                                                                                        |
|                     | <b>NAPT</b>                                | Network Address and Port Translation (NAPT) refers to network address translation involving the mapping of port numbers, allowing multiple machines to share a single IP address. Use NAPT if your LAN encompasses multiple devices, a topology that necessitates port translation in addition to address translation. |

| Parameter                                 | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Device Metric</b>                      | The device metric is a value used by the Telephone Adapter to determine whether one route is superior to another, considering parameters such as bandwidth, delay, and more.                                                                                                                                                                                                     |
| <b>Default Route</b>                      | Select this check box to define this device as a the default route.                                                                                                                                                                                                                                                                                                              |
| <b>Routing Information Protocol (RIP)</b> | Select this check box to enable the Routing Information Protocol (RIP). RIP determines a route based on the smallest hop count between source and destination. When RIP is enabled, select the following:<br><br>Listen to RIP messages - select 'None', 'RIPv1', 'RIPv2' or 'RIPv1/2'.<br><br>Send RIP messages select 'None', 'RIPv1', 'RIPv2-broadcast' or 'RIPv2-multicast'. |
| <b>Multicast - IGMP Proxy Internal</b>    | IGMP proxy enables the system to issue IGMP host messages on behalf of hosts that the system discovered through standard IGMP interfaces. IGMP proxy enables the routing of multicast packets according to the IGMP requests of LAN devices asking to join multicast groups. Select the 'Multicast IGMP Proxy Internal' check-box to enable this feature.                        |
| <b>Routing Table</b>                      | Allows you to add or modify routes when this device is active. Use the 'New Route' button to add a route or edit existing routes.                                                                                                                                                                                                                                                |

### 9.1.5 Advanced Routing Properties

Refer to 'Routing' on page 82.

### 9.1.6 Internet Connection Firewall

Your Telephone Adapter's firewall helps protect your computer by preventing unauthorized users from gaining access to it through a network such as the Internet. The firewall can be activated per network connection. To enable the firewall on this network connection, select the 'Enabled' check box. For detailed information on your Telephone Adapter's security features, refer to 'Security' on page 137.

**Figure 9-6: Internet Connection Firewall**

**Figure 9-7: Additional IP Addresses**

You can add alias names (additional IP addresses) to the Telephone Adapter by clicking the link 'New IP Address'. This enables you to access the Telephone Adapter using these aliases in addition to 192.168.1.1 and <http://mp202.home>.

## 9.2 WAN PPPoE

Point-to-Point Protocol over Ethernet (PPPoE) relies on two widely accepted standards, PPP and Ethernet. PPPoE enables your home network PCs that communicate on an Ethernet network to exchange information with PCs on the Internet. PPPoE supports the protocol layers and authentication widely used in PPP and enables a point-to-point connection to be established in the normally multipoint architecture of Ethernet. A discovery process in PPPoE determines the Ethernet MAC address of the remote device in order to establish a session.

### 9.2.1 General

**Table 9-3: PPPoE Parameter Descriptions**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Schedule</b>              | You can configure scheduler rules in order to define time segments during which the connection is active (via Advanced>Scheduler Rules).                                                                                                                                                                                                                                                                   |
| <b>Network</b>               | Select whether the parameters you are configuring relate to a LAN/WAN connection, by selecting LAN/WAN from the drop down list.                                                                                                                                                                                                                                                                            |
| <b>MTU</b>                   | MTU is the Maximum Transmission Unit. It specifies the largest packet size permitted for Internet transmission. The default setting, Manual, allows you to enter the largest packet size that will be transmitted. The recommended size, is 1492. You should leave this value in the 1200 to 1500 range. To have the Telephone Adapter select the best MTU for your Internet connection, select Automatic. |
| <b>Underlying Connection</b> | Specify the underlying connection above which the protocol will be initiated.                                                                                                                                                                                                                                                                                                                              |

**Figure 9-8: General PPPoE Settings**

| General                |                         |
|------------------------|-------------------------|
| Device Name:           | ppp0                    |
| Status:                | Disconnected            |
| Schedule:              | Always <span>New</span> |
| Network:               | WAN                     |
| Connection Type:       | PPPoA                   |
| MTU:                   | Automatic 1492          |
| Underlying Connection: | WAN DSL                 |

### 9.2.2 PPP Configuration

Point-to-Point Protocol (PPP) is the most popular method for transporting packets between the user and the Internet service provider. PPP supports authentication protocols such as PAP and CHAP, as well as other compression and encryption protocols.

**Table 9-4: PPP Configuration Parameter Descriptions**

| Parameter                              | Description                                                                                                              |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Service Name</b>                    | Specify the networking peer's service name, if provided by your ISP.                                                     |
| <b>PPP-on-Demand</b>                   | Use PPP on demand to initiate the point-to-point protocol session only when packets are actually sent over the Internet. |
| <b>Time Between Reconnect Attempts</b> | Specify the duration between PPP reconnected attempts, as provided by your ISP.                                          |

**Figure 9-9: PPP Configuration**

|                                                                                         |                                         |
|-----------------------------------------------------------------------------------------|-----------------------------------------|
| <b>PPP</b>                                                                              |                                         |
| Service Name (should be filled only if specified by provider):                          | <input type="text"/>                    |
| <input type="checkbox"/> On Demand (will attempt to connect only when packets are sent) |                                         |
| Time Between Reconnect Attempts:                                                        | <input type="text" value="30"/> Seconds |

### 9.2.3 PPP Authentication

Point-to-Point Protocol (PPP) currently supports four authentication protocols:

1. Password Authentication Protocol (PAP)
2. Challenge Handshake Authentication Protocol (CHAP)
3. Microsoft CHAP version 1
4. Microsoft CHAP version 2

This section allows you to select the authentication protocols your gateway may use when negotiating with a PPTP server. Select all the protocols if no information is available about the server's authentication protocols. Note that encryption is performed only if 'Microsoft CHAP', 'Microsoft CHAP version 2', or both are selected.

**Figure 9-10: PPP Authentication Settings**

| PPP Authentication                                                                |                                        |
|-----------------------------------------------------------------------------------|----------------------------------------|
| Login User Name (case sensitive):                                                 | <input type="text" value="dina"/>      |
| Login Password:                                                                   | <input type="password" value="....."/> |
| <input type="checkbox"/> Support Unencrypted Password (PAP)                       |                                        |
| <input type="checkbox"/> Support Challenge Handshake Authentication (CHAP)        |                                        |
| <input checked="" type="checkbox"/> Support Microsoft CHAP (MS-CHAP)              |                                        |
| <input checked="" type="checkbox"/> Support Microsoft CHAP Version 2 (MS-CHAP v2) |                                        |

**Table 9-5: PPP Authentication Parameter Descriptions**

| Parameter                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Login User Name</b>                                   | As agreed with ISP.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Login Password</b>                                    | As agreed with ISP.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Support Unencrypted Password (PAP)</b>                | Password Authentication Protocol (PAP) is a simple, plaintext authentication scheme. The user name and password are requested by your networking peer in plaintext. PAP, however, is not a secure authentication protocol. Man-in-the-middle attacks can easily determine the remote access client's password. PAP offers no protection against replay attacks, remote client impersonation, or remote server impersonation. |
| <b>Support Challenge Handshake Authentication (CHAP)</b> | The Challenge Handshake Authentication Protocol (CHAP) is a challenge-response authentication protocol that uses MD5 to hash the response to a challenge. CHAP protects against replay attacks by using an arbitrary challenge string per authentication attempt.                                                                                                                                                            |
| <b>Support Microsoft CHAP</b>                            | Select this check box if you are communicating with a peer that uses Microsoft CHAP authentication protocol.                                                                                                                                                                                                                                                                                                                 |
| <b>Support Microsoft CHAP Version 2</b>                  | Select this check box if you are communicating with a peer that uses Microsoft CHAP Version 2 authentication protocol.                                                                                                                                                                                                                                                                                                       |

## 9.2.4 PPP Encryption

PPP supports encryption facilities to secure the data across the network connection. A wide variety of encryption methods may be negotiated, although typically only one method is used in each direction of the link.

Note that PPP encryption can only be used with MS-CHAP or MS-CHAP-V2 authentication algorithms.

**Figure 9-11: PPP Encryption**

| PPP Encryption                                                              |
|-----------------------------------------------------------------------------|
| <input type="checkbox"/> Require Encryption (Disconnect If Server Declines) |
| <input type="checkbox"/> Support Encryption (40 Bit Keys)                   |
| <input type="checkbox"/> Support Maximum Strength Encryption (128 Bit Keys) |

**Table 9-6: PPP Encryption Parameter Descriptions**

| Parameter                                                 | Description                                                           |
|-----------------------------------------------------------|-----------------------------------------------------------------------|
| <b>Require Encryption</b>                                 | Select this check box to ensure that the PPP connection is encrypted. |
| <b>Support Encryption (40 Bit Keys)</b>                   | Select this check box if your peer supports 40 bit encryption keys.   |
| <b>Support Maximum Strength Encryption (128 Bit Keys)</b> | Select this check box if your peer supports 128 bit encryption keys.  |

## 9.2.5 PPP Compression

The PPP Compression Control Protocol (CCP) is responsible for configuring, enabling, and disabling data compression algorithms on both ends of the point-to-point link. It is also used to signal a failure of the compression/ decompression mechanism in a reliable manner.

**Figure 9-12: PPP Compression**

| PPP Compression |                                         |
|-----------------|-----------------------------------------|
| BSD:            | <input type="button" value="Reject"/> ▼ |
| Deflate:        | <input type="button" value="Reject"/> ▼ |

For each compression algorithm, select one of the following from the drop down menu:

**Table 9-7: PPP Compression Parameter Descriptions**

| Parameter      | Description                                                           |
|----------------|-----------------------------------------------------------------------|
| <b>Reject</b>  | Reject PPP connections with peers that use the compression algorithm. |
| <b>Allow</b>   | Allow PPP connections with peers that use the compression algorithm.  |
| <b>Require</b> | Ensure a connection with a peer is using the compression algorithm.   |

## **9.2.9 Internet Connection Firewall**

Refer to 'Internet Connection Firewall' on page [77](#)

## **9.3 WAN PPTP**

Point-to-Point Tunneling Protocol (PPTP) is a protocol developed by Microsoft targeted at creating VPN connections over the Internet. This enables remote users to access the gateway via any ISP that supports PPTP on its servers. PPTP encapsulates network traffic, encrypts content using Microsoft's Point-to-Point Encryption (MPPE) protocol that is based on RC4, and routes using the generic routing encapsulation (GRE) protocol.

With your gateway, PPTP is targeted at serving two purposes:

1. Connecting the gateway to the Internet when it is used as a cable modem, or when using an external cable modem. Such a connection is established using user name and password authentication.
2. Connecting the gateway to a remote network using a Virtual Private Network (VPN) tunnel over the Internet. This enables secure transfer of data to another location over the Internet, using user name and password authentication.

### **9.3.1 Creating a PPTP Connection with the Connection Wizard**

➤ **To create a new PPTP connection, take these steps:**

1. Open the screen 'Network Connections' and click the link 'New Connection'; the 'Connection Wizard' screen opens.
2. Select the radio button 'Internet Connection' and click 'Next'; the screen 'Internet Connection' opens.

3. Select the radio button External Cable Modem (this option is for both internal and external cable modems) and click 'Next'; the screen 'Internet Cable Modem Connection' opens (refer to the figure).

**Figure 9-13: Internet Cable Modem Connection**

The figure shows a window titled "Internet Cable Modem Connection" with a small icon of a computer and a modem. Below the title, it says "Choose your Internet connection type:". There are three radio button options, each with a description: "Ethernet Connection" (selected), "Point-To-Point Tunneling Protocol (PPTP) with User Name and Password Authentication", and "Layer 2 Tunneling Protocol (L2TP) with User Name and Password Authentication". At the bottom, there are three buttons: "< Back", "Next >", and "X Cancel".

**Internet Cable Modem Connection**

Choose your Internet connection type:

- ☒ **Ethernet Connection**  
My ISP doesn't require user name and password in order to me connect to the Internet.
- ☐ **Point-To-Point Tunneling Protocol (PPTP) with User Name and Password Authentication**  
My ISP requires user name and password in order to connect me to the Internet using a PPTP connection.
- ☐ **Layer 2 Tunneling Protocol (L2TP) with User Name and Password Authentication**  
My ISP requires user name and password in order to connect me to the Internet using a L2TP connection.

< Back    Next >    X Cancel

4. Select the radio button 'Point-To-Point Tunneling Protocol (PPTP) with User Name and Password Authentication' and click Next; the screen 'Point-to-Point Tunneling Protocol (PPTP)' opens (refer to the figure).

**Figure 9-14: Point-to-Point Tunneling Protocol**

**Point-to-Point Tunneling Protocol (PPTP)**

Configure your PPTP connection properties:

|                                      |                                      |
|--------------------------------------|--------------------------------------|
| Login User Name (case sensitive):    | john_smith                           |
| Login Password:                      | ••••                                 |
| PPTP Server Host Name or IP Address: | my_isp_pptp                          |
| Internet Protocol:                   | Obtain an IP Address Automatically ▼ |

< Back      Next >      X Cancel

5. Enter the username and password provided by your Internet Service Provider (ISP).
6. Enter the PPTP server host name or IP address provided by your ISP.
7. Select whether to obtain an IP address automatically or specify one.
8. Click Next; the screen 'Connection Summary' opens (refer to the figure).

**Figure 9-15: Connection Summary**

**Connection Summary**

You have successfully completed the steps needed to create the following connection:

- Point-to-Point Tunneling Protocol to my\_isp\_pptp
- User Name: john\_smith

☐ Edit the Newly Created Connection

Press **Finish** to create the connection.

< Back      ✓ Finish      X Cancel

9. Check the 'Edit the Newly Created Connection' check box if you wish to be routed to the new connection's configuration screen after clicking Finish.

10. Click Finish to save the settings; the new PPTP connection is added to the network connections list and is configurable like any other connection.

### 9.3.2 Creating a PPTP VPN Connection with the Connection Wizard

➤ **To create a new PPTP VPN connection, take these steps:**

1. Open the screen 'Network Connections' and click link 'New Connection'; the screen 'Connection Wizard' opens.
2. Select the radio button 'Connect to a Virtual Private Network over the Internet' and click 'Next'; the screen 'Connect to a Virtual Private Network over the Internet' opens.
3. Select the radio button 'VPN Client or Point-To-Point' and click 'Next'; the screen 'VPN Client or Point-To-Point' opens (refer to the figure).

**Figure 9-16: VPN Client or Point-To-Point**

**VPN Client or Point-To-Point**

Choose one of the following protocols to connect to a remote VPN server:

- ☒ **Point-to-Point Tunneling Protocol Virtual Private Network (PPTP VPN)**  
Enable secure transfer of data to another location over the Internet, using user name/password authentication.
- ☐ **Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)**  
Enable secure transfer of data to another location over the Internet, using private and public keys for encryption and digital certificates and user name/password for authentication.
- ☐ **Internet Protocol Security (IPsec)**  
Enable secure transfer of data to another location over the Internet, using private and public keys for encryption and digital certificates or shared secret for authentication.

< Back   Next >   X Cancel

4. Select the 'Point-to-Point Tunneling Protocol Virtual Private Network (PPTP VPN)' radio button and click Next. The 'Point-to-Point Tunneling Protocol Virtual Private Network (PPTP VPN)' screen will appear (see figure 8.205).

**Figure 9-17: Point-to-Point Tunneling Protocol Virtual Private Network (PPTP VPN)**

**Point-to-Point Tunneling Protocol Virtual Private Network (PPTP VPN)**

Configure your PPTP VPN connection properties:

|                                   |            |
|-----------------------------------|------------|
| Login User Name (case sensitive): | john_smith |
| Login Password:                   | ••••       |
| Remote Tunnel Endpoint Address:   | 191.52.3.1 |

< Back    Next >    X Cancel

5. Enter the username and password provided by the administrator of the network you are trying to access.
6. Enter the remote tunnel endpoint address. This would be the IP address or domain name of the remote network computer, which serves as the tunnel's endpoint.
7. Click 'Next'; the screen 'Connection Summary' opens (refer to the figure).

**Figure 9-18: Connection Summary**

**Connection Summary**

You have successfully completed the steps needed to create the following connection:

- Point-to-Point Tunneling Protocol to 191.52.3.1 VPN server
- User Name: john\_smith

☐ Edit the Newly Created Connection

Press **Finish** to create the connection.

< Back    ✓ Finish    X Cancel

8. Check the check box 'Edit the Newly Created Connection' if you wish to be routed to the new connection's configuration screen after clicking Finish.

9. Click Finish to save the settings; the new PPTP VPN connection is added to the network connections list and is configurable like any other connection.

### 9.3.3 General

This section displays the connection's general parameters.

**Figure 9-19: General PPTP Settings**

| General          |                                                                            |
|------------------|----------------------------------------------------------------------------|
| Device Name:     | ppp200                                                                     |
| Status:          | Disconnected                                                               |
| Schedule:        | Always <span style="float: right;">New</span>                              |
| Network:         | <span style="border: 1px solid black; padding: 2px;">WAN</span>            |
| Connection Type: | VPN PPTP                                                                   |
| MTU:             | <span style="border: 1px solid black; padding: 2px;">Automatic</span> 1460 |

**Table 9-8: General PPTP Settings**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Schedule</b> | By default, the connection is always active. However, you can configure scheduler rules (via Advanced>Scheduler Rules) in order to define time segments during which the connection may be active. Once a scheduler rule(s) is defined, this field changes to a drop-down list, allowing you to choose between the available rules.                                        |
| <b>Network</b>  | Select whether the parameters you are configuring relate to a WAN, LAN or DMZ connection, by selecting the connection type from the drop-down list.                                                                                                                                                                                                                        |
| <b>MTU</b>      | MTU is the Maximum Transmission Unit. It specifies the largest packet size permitted for Internet transmission. When set to its default (Automatic), the gateway selects the best MTU for your Internet connection. Select 'Automatic by DHCP' for the DHCP to determine the MTU. If you select 'Manual', it is recommended to enter a value in the range of 1200 to 1500. |

## 9.4 WAN L2TP

Layer 2 Tunneling Protocol (L2TP) is an extension to the PPP protocol, enabling your gateway to create VPN connections. Derived from Microsoft's Point-to-Point Tunneling Protocol (PPTP) and Cisco's Layer 2 Forwarding (L2F) technology, L2TP encapsulates PPP frames into IP packets either at the remote user's PC or at an ISP that has an L2TP Remote Access Concentrator (LAC). The LAC transmits the L2TP packets over the network to the L2TP Network Server (LNS) at the corporate side.

With your gateway, L2TP is targeted at serving two purposes:

1. Connecting the gateway to the Internet when it is used as a cable modem, or when using an external cable modem. Such a connection is established using user name and password authentication.
2. Connecting the gateway to a remote network using a Virtual Private Network (VPN) tunnel over the Internet. This enables secure transfer of data to another location over the Internet, using private and public keys for encryption and digital certificates, and user name and password for authentication.

### 9.4.1 Creating an L2TP IPsec VPN Connection with the Connection Wizard

➤ **To create a new L2TP IPsec VPN connection, take these steps:**

1. Click the link 'New Connection' in the screen 'Network Connections'; the screen 'Connection Wizard' opens.
2. Select the radio button 'Connect to a Virtual Private Network over the Internet' and click 'Next'; the screen 'Connect to a Virtual Private Network over the Internet' opens.

3. Select the radio button 'VPN Client or Point-To-Point' and click 'Next'; the screen 'VPN Client or Point-To-Point' opens(refer to the figure).

**Figure 9-20: VPN Client or Point-To-Point**

**VPN Client or Point-To-Point**

Choose one of the following protocols to connect to a remote VPN server:

☒ **Point-to-Point Tunneling Protocol Virtual Private Network (PPTP VPN)**  
  
 Enable secure transfer of data to another location over the Internet, using user name/password authentication.

☐ **Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)**  
  
 Enable secure transfer of data to another location over the Internet, using private and public keys for encryption and digital certificates and user name/password for authentication.

☐ **Internet Protocol Security (IPsec)**  
  
 Enable secure transfer of data to another location over the Internet, using private and public keys for encryption and digital certificates or shared secret for authentication.

< Back
Next >
X Cancel

4. Check the radio button 'Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)' and click 'Next'; the screen 'Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)' opens (refer to the figure).

**Figure 9-21: Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)**

**Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)**

Configure your L2TP VPN connection properties:

|                                   |            |
|-----------------------------------|------------|
| Login User Name (case sensitive): | john_smith |
| Login Password:                   | ....       |
| IPsec Shared Secret:              | .....      |
| Remote Tunnel Endpoint Address:   | 191.52.3.1 |

< Back   Next >   X Cancel

5. Enter the username and password provided by the administrator of the network you are trying to access.
6. Enter the IPsec shared secret, which is the encryption key jointly decided upon with the network you are trying to access.
7. Enter the remote tunnel endpoint address. This would be the IP address or domain name of the remote network computer, which serves as the tunnel's endpoint.

8. Click 'Next'; the screen 'Connection Summary' opens (refer to the figure).

**Figure 9-22: Connection Summary**

9. Check the check box 'Edit the Newly Created Connection' to be routed to the new connection's configuration screen after clicking 'Finish'.
10. Click 'Finish' to save the settings; the new L2TP IPsec VPN connection is added to the network connections list and is configurable like any other connection.

## 9.4.2 Creating an L2TP IPsec VPN Connection with the Connection Wizard

### ➤ To create a new L2TP IPsec VPN connection, take these steps:

1. Click the link 'New Connection' in the screen 'Network Connections'; the screen 'Connection Wizard' opens.
2. Select the radio button 'Connect to a Virtual Private Network over the Internet' and click 'Next'; the screen 'Connect to a Virtual Private Network over the Internet' opens.

3. Select the radio button 'VPN Client or Point-To-Point' and click 'Next'; the screen 'VPN Client or Point-To-Point' opens (refer to the figure).

**Figure 9-23: VPN Client or Point-To-Point**

**VPN Client or Point-To-Point**

Choose one of the following protocols to connect to a remote VPN server:

- ☒ **Point-to-Point Tunneling Protocol Virtual Private Network (PPTP VPN)**  
Enable secure transfer of data to another location over the Internet, using user name/password authentication.
- ☐ **Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)**  
Enable secure transfer of data to another location over the Internet, using private and public keys for encryption and digital certificates and user name/password for authentication.
- ☐ **Internet Protocol Security (IPsec)**  
Enable secure transfer of data to another location over the Internet, using private and public keys for encryption and digital certificates or shared secret for authentication.

< Back   Next >   X Cancel

4. Select the radio button 'Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)' and click 'Next'; the screen 'Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)' opens (refer to the figure).

**Figure 9-24: Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)**

**Layer 2 Tunneling Protocol over Internet Protocol Security (L2TP IPsec VPN)**

Configure your L2TP VPN connection properties:

|                                   |            |
|-----------------------------------|------------|
| Login User Name (case sensitive): | john_smith |
| Login Password:                   | ••••       |
| IPSec Shared Secret:              | ••••••••   |
| Remote Tunnel Endpoint Address:   | 191.52.3.1 |

< Back   Next >   X Cancel

5. Enter the username and password provided by the administrator of the network you are trying to access.
6. Enter the IPsec shared secret, which is the encryption key jointly decided upon with the network you are trying to access.
7. Enter the remote tunnel endpoint address. This would be the IP address or domain name of the remote network computer, which serves as the tunnel's endpoint.
8. Click Next. The 'Connection Summary' screen will appear (see figure 8.184).

**Figure 9-25: Connection Summary**

**Connection Summary**

You have successfully completed the steps needed to create the following connection:

- Layer 2 Tunneling Protocol to 191.52.3.1 VPN server
- User Name: john\_smith

☐ Edit the Newly Created Connection

Press **Finish** to create the connection.

< Back   ✓ Finish   X Cancel

9. Check the check box 'Edit the Newly Created Connection' to be routed to the new connection's configuration screen after clicking 'Finish'.
10. Click 'Finish' to save the settings; the new L2TP IPsec VPN connection is added to the network connections list; it is configurable like any other connection.

### 9.4.3 General

This section displays the connection's general parameters.

| General          |                  |
|------------------|------------------|

| Connection Type: | L2TP             |
| MTU:             | Automatic ▼ 1456 |

**Table 9-9: General Settings**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Schedule</b> | By default, the connection is always active. However, you can configure scheduler rules (via Advanced>Scheduler Rules) in order to define time segments during which the connection may be active. Once a scheduler rule(s) is defined, this field changes to a drop-down list, allowing you to choose between the available rules.                                        |
| <b>Network</b>  | Select whether the parameters you are configuring relate to a WAN, LAN or DMZ connection, by selecting the connection type from the drop-down list.                                                                                                                                                                                                                        |
| <b>MTU</b>      | MTU is the Maximum Transmission Unit. It specifies the largest packet size permitted for Internet transmission. When set to its default (Automatic), the gateway selects the best MTU for your Internet connection. Select 'Automatic by DHCP' for the DHCP to determine the MTU. If you select 'Manual', it is recommended to enter a value in the range of 1200 to 1500. |

### 9.4.4 PPP Configuration

Refer to 'PPP Configuration' on page 78

### 9.4.5 PPP Authentication

Refer to 'PPP Authentication' on page [79](#)

### 9.4.6 PPP Encryption

Refer to 'PPP Encryption' on page [80](#)

### 9.4.7 PPP Compression

The PPP Compression Control Protocol (CCP) is responsible for configuring, enabling, and disabling data compression algorithms on both ends of the point-to-point link. It is also used to signal a failure of the compression/ decompression mechanism in a reliable manner.

**Figure 9-26: PPP Compression**

| PPP Compression |                                         |
|-----------------|-----------------------------------------|
| BSD:            | <input type="button" value="Reject"/> ▾ |
| Deflate:        | <input type="button" value="Reject"/> ▾ |

For each compression algorithm, select one of the following from the drop down menu:

**Table 9-10: PPTP Compression Parameters**

| Parameter      | Description                                                           |
|----------------|-----------------------------------------------------------------------|
| <b>Reject</b>  | Reject PPP connections with peers that use the compression algorithm. |
| <b>Allow</b>   | Allow PPP connections with peers that use the compression algorithm.  |
| <b>Require</b> | Ensure a connection with a peer is using the compression algorithm.   |

### 9.4.8 Internet Protocol

### 9.4.9 DNS Server

Refer to 'DNS Server' on page [76](#)

### 9.4.10 Routing

Refer to 'Routing' on page [76](#)

### 9.4.11 Internet Connection Firewall

Refer to 'Internet Connection Firewall' on page [77](#)

## 10 VLAN and Bridge Settings

### 10.1 Virtual LAN Interface (VLAN)

#### 10.1.1 Creation with the Connection Wizard

➤ **To create a new VLAN interface:**

1. Click the New Connection link in the 'Network Connections' screen (refer to the figure); the 'Connection Wizard' screen opens (refer to the figure).
2. Select the Advanced Connection radio button and click Next; the 'Advanced Connection' screen appears (refer to the figure).
3. Select the VLAN Interface radio button and click Next. The 'VLAN Interface' screen appears (refer to the figure).

**Figure 10-1: VLAN Interface**

**VLAN Interface**

Configure new VLAN interface:

Underlying Device: WAN Ethernet

VLAN ID: 1

< Back   Next >   X Cancel

4. Select the underlying device for this interface. The combo box displays the device's Ethernet connections.

5. Enter a value that will serve as the VLAN ID, and click Next; the 'Connection Summary' screen appears (refer to the figure).

**Figure 10-2: Connection Summary**

6. Check the 'Edit the Newly Created Connection' check box to be routed to the new connection's configuration screen after clicking Finish.
7. Click Finish to save the settings; the new VLAN interface is added to the network connections list; it's configurable like any other connection.

## 10.1.2 General

The top part of the configuration window displays general communication parameters. It's recommended to leave the values in this screen at their defaults unless you're familiar with the networking concepts they represent. Since your Telephone Adapter is configured to operate with the default values, no parameter modification is necessary. You can configure the following general connection settings:

**Table 10-1: VLAN Interface - General Communication Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Schedule              | By default, the connection will always be active. However, you can configure scheduler rules in order to define time segments during which the connection may be active. Once a scheduler rule(s) is defined (via Advanced>Scheduler Rules), this field changes to a combo box, allowing you to choose between the available rules. To configure scheduler rules, refer to Section 10.11. |
| Network               | Select whether the parameters you are configuring relate to a WAN, LAN or DMZ connection, by selecting the connection type from the combo box. For detailed information, refer to Section 4.2.                                                                                                                                                                                            |
| Physical Address      | The physical address of the network card used for your network. Some cards allow you to change this address.                                                                                                                                                                                                                                                                              |
| Clone MAC             | Allows you to copy the current MAC address of your PC to the MAC address of this device.                                                                                                                                                                                                                                                                                                  |
| MTU                   | MTU is the Maximum Transmission Unit. It specifies the largest packet size permitted for Internet transmission. In the default setting, Automatic, the Telephone Adapter selects the best MTU for your Internet connection. In case you change to manual, you can enter the largest packet size, you should leave this value in the 1200 to 1500 range.                                   |
| Underlying Connection | The Ethernet device that the connection is implemented over.                                                                                                                                                                                                                                                                                                                              |

Select one of the following Internet Protocol options from the 'Internet Protocol' drop down menu:

- No IP Address
- Obtain an IP Address Automatically
- Use the Following IP Address

Note that according to the selection you make in the 'Internet Protocol' drop down menu, the screen will refresh and display relevant configuration settings.

|               |                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No IP Address | Select 'No IP Address' if you require that your Telephone Adapter has no IP address. This can be useful if you are working in an environment where you are not connected to other networks, such as the Internet. |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Figure 10-3: Internet Protocol Settings - No IP Address**

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Obtain an IP Address Automatically | <p>Your WAN connection is configured by default to act as a DHCP client. You should keep this configuration in case your service provider supports DHCP, or if you are connecting using a dynamic IP address.</p> <p>The server that assigns the Telephone Adapter with an IP address, also assigns a subnet mask. You can override the dynamically assigned subnet mask by selecting the 'Override Subnet Mask' and specifying your own mask instead.</p> <p>You can press the 'Release' button to release the current leased IP address. Once the address has been released, the button text changes to 'Renew'. Use the 'Renew' button to renew the leased IP address.</p> |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 10.1.3 IP Address Distribution

The 'IP Address Distribution' section allows you to configure the device's Dynamic Host Configuration Protocol (DHCP) server parameters. The DHCP automatically assigns IP addresses to network PCs. If you enable this feature, make sure that you also configure your network PCs as DHCP clients. For a comprehensive description of this feature, refer to Section 10.28.

Select one of the following options from the 'IP Address Distribution' combo box:

**Table 10-2: IP Address Distribution Parameters**

| Parameter                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCP Server                                  | Start IP Address The first IP address that may be assigned to a LAN host. Since the device's default IP address is 192.168.2.1, this address must be 192.168.2.2 or greater.                                                                                                                                                                                                                                                       |
| End IP Address                               | The last IP address in the range that can be used to automatically assign IP addresses to LAN hosts.                                                                                                                                                                                                                                                                                                                               |
| Subnet Mask                                  | A mask used to determine to what subnet an IP address belongs. An example of a subnet mask value is 255.255.0.0.                                                                                                                                                                                                                                                                                                                   |
| Lease Time In Minutes                        | Each device will be assigned an IP address by the DHCP server for this amount of time, when it connects to the network. When the lease expires the server will determine if the computer has disconnected from the network. If it has, the server may reassign this IP address to a newly-connected computer. This feature ensures that IP addresses that are not in use will become available for other computers on the network. |
| Provide Host Name If Not Specified by Client | If the DHCP client does not have a host name, the device will automatically assign one for him.                                                                                                                                                                                                                                                                                                                                    |

|            |                                                                                                                                                                                                                                                                                                                           |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCP Relay | Your device can act as a DHCP relay in case you would like to dynamically assign IP addresses from a DHCP server other than your Telephone Adapter's DHCP server. Note that when selecting this option you must also change the device's WAN to work in routing mode. For detailed information, refer to Section 10.28.2. |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

1. After selecting 'DHCP Relay' from the drop down menu, a 'New IP Address' link appears:

**Figure 10-7: IP Address Distribution - DHCP Relay**

2. Click the 'New IP Address' link. The 'DHCP Relay Server Address' screen appears:

**Figure 10-8: DHCP Relay Server Address**

3. Specify the IP address of the DHCP server.
4. Click 'OK' to save the settings.

|          |                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------|
| Disabled | Select 'Disabled' from the combo-box if you would like to statically assign IP addresses to your network computers. |
|----------|---------------------------------------------------------------------------------------------------------------------|

**Figure 10-9: IP Address Distribution - Disable DHCP**

### 10.1.4 Routing

You can choose to setup your Telephone Adapter to use static or dynamic routing. Dynamic routing automatically adjusts how packets travel on the network, whereas static routing specifies a fixed routing path to neighboring destinations.

**Table 10-3: Routing Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Routing                            | Select 'Advanced' or 'Basic' routing.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Routing Mode                       | Select one of the following Routing modes:                                                                                                                                                                                                                                                                                                                                                                                                        |
| Route                              | Use route mode if you want your device to function as a router between two networks.                                                                                                                                                                                                                                                                                                                                                              |
| NAT                                | Network Address Translation (NAT) translates IP addresses to a valid, public address on the Internet. This adds security since internal LAN addresses are not transmitted over the Internet. In addition, NAT allows many addresses to exist behind a single valid address. Use the NAT routing mode if your LAN consists of a single device, otherwise collisions may occur if more than one device attempts to communicate using the same port. |
| NAPT                               | Network Address and Port Translation (NAPT) refers to network address translation involving the mapping of port numbers, allowing multiple machines to share a single IP address. Use NAPT if your LAN encompasses multiple devices, a topology that necessitates port translation in addition to address translation.                                                                                                                            |
| Device Metric                      | The device metric is a value used by the device to determine whether one route is superior to another, considering parameters such as bandwidth, delay, and more.                                                                                                                                                                                                                                                                                 |
| Default Route                      | Select this check box to define this device as a the default route.                                                                                                                                                                                                                                                                                                                                                                               |
| Routing Information Protocol (RIP) | Select this check box to enable the Routing Information Protocol (RIP). RIP determines a route based on the smallest hop count between source and destination. When RIP is enabled, select the following:                                                                                                                                                                                                                                         |
| Listen to RIP messages             | Select 'None', 'RIPv1', 'RIPv2' or 'RIPv1/2'.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Send RIP messages                  | Select 'None', 'RIPv1', 'RIPv2-broadcast' or 'RIPv2-multicast'.                                                                                                                                                                                                                                                                                                                                                                                   |
| Multicast                          | IGMP Proxy Internal IGMP proxy enables the system to issue IGMP host messages on behalf of hosts that the system discovered through standard IGMP interfaces. IGMP proxy enables the routing of multicast packets according to the IGMP requests of LAN devices asking to join multicast groups. Select the 'Multicast IGMP Proxy Internal' check-box to enable this feature.                                                                     |
| Routing Table                      | Allows you to add or modify routes when this device is active. Use the 'New Route' button to add a route or edit existing routes.                                                                                                                                                                                                                                                                                                                 |

**Figure 10-10: Advanced Routing Properties**

| Name                                                                | Destination | Gateway     | Netmask         | Metric | Status  | Action                                                                                                                                                                  |
| LAN Ethernet                                                        | 192.168.2.4 | 192.168.1.1 | 255.255.255.255 | 2      | Applied |   |
| New Route                                                           |             |             |                 |        |         |                                                                                      |

For detailed information on this feature, refer to Section 10.17.

### 10.1.5 Internet Connection Firewall

Your Telephone Adapter's firewall helps protect your computer by preventing unauthorized users from gaining access to it through a network such as the Internet. The firewall can be activated per network connection. To enable the firewall on this network connection, select the 'Enabled' check box. For detailed information on your device's security features, refer to Section 5.

**Figure 10-11: Internet Connection Firewall**

|                                     |                                  |
|-------------------------------------|----------------------------------|
| <b>Internet Connection Firewall</b> | <input type="checkbox"/> Enabled |
|-------------------------------------|----------------------------------|

### 10.1.6 Allow Unrestricted Administration

Select this check box to enable users other than those defined as 'Administrator' to change the device's configuration.

**Figure 10-12: Allow Unrestricted Administration**

|                                          |                                  |
|------------------------------------------|----------------------------------|
| <b>Allow Unrestricted Administration</b> | <input type="checkbox"/> Enabled |
|------------------------------------------|----------------------------------|

## 10.1.7 Additional IP Addresses

You can add alias names (additional IP addresses) to the Telephone Adapter by clicking the 'New IP Address' link. This enables you to access the device using these aliases in addition to 192.168.1.1 and <http://MP-202.home>.

**Figure 10-13: Additional IP Addresses**

| Additional IP Addresses | New IP Address |
|-------------------------|----------------|
|-------------------------|----------------|

## 10.1.8 Example of Configuring 3 VLANs: VoIP, Data and Management

This example explains how to configure three separate VLANs: VoIP, data and management.

### Setup

Two MP-202s are connected to the switch. Both are configured to use VLAN 300 for VoIP, VLAN 521 for Data and VLAN 311 for management. A station is connected to the switch in VLAN 311 (management).

**Figure 10-14: Using VLAN - Setup**

➤ **To configure separate VLANs for VoIP, Data and Management packets:**

1. (For MP202-1) Open menu Advanced > Remote Administration; open 'Using Primary HTTP Port (80)' and 'Allow Incoming ICMP Echo Requests (e.g. pings and ICMP traceroute queries)'
2. For VOIP, add VLAN ID 300. Set the new WAN interface to use static route 3.3.3.3. Choose advanced route. In 'advanced route', choose ROUTE mode, device metric = 0 and check the 'default gateway' check box.
3. For Data, add VLAN ID 521. Set the new WAN interface to use static route 5.5.5.5. Choose advanced route. In 'advanced route', choose NAPT mode, device metric = 1 and check the 'default gateway' check box.
4. For Management, add VLAN ID 311. Set the new WAN interface to use static route 11.11.11.11. Choose advanced route. In 'advanced route', choose ROUTE mode, device metric = 2 and check the 'default gateway' check box.
5. Add static route. Do so for all packets with destination IP 11.11.x.x, to use default the device whose address is 11.11.11.11.
6. To deny access to web management for all interfaces except VLAN 311, add an 'input rule' in 'advanced filtering' and deny all HTTP packets. Do this for each interface except the interface with VLAN 311.
7. Repeat the same steps for MP202-2. Use a different IP address.
8. To access the web management for both MP-202-1 and MP-202-2, connect a PC that works on the same VLAN management (311).

## Defining a VLAN, Configuring its Interface

➤ **To define an interface VLAN:**

1. Open menu Network Connections > New Connection > Advanced Connection > VLAN Interface; the screen VLAN Interface opens (refer to the figure).

**Figure 10-15: Example of Using VLAN - VLAN Interface Screen**

**VLAN Interface**

Configure new VLAN interface:

Underlying Device: WAN Ethernet

VLAN ID: 100

< Back    Next >    Cancel

2. Define a VLAN ID for each device. Verify that you've got a new interface on the WAN side (WAN Ethernet 2) (refer to the figure below).

**Figure 10-16: Verifying a New Interface on the WAN Side**

| Network Connections                      |              |                                                                                     |
|------------------------------------------|--------------|-------------------------------------------------------------------------------------|
| Name                                     | Status       | Action                                                                              |
| WAN Ethernet                             | Connected    |  |
| LAN Ethernet                             | Disconnected |  |
| WAN Ethernet 2                           | Connected    |  |
| New Connection                           |              |  |
| <div>Quick Setup</div> <div>Status</div> |              |                                                                                     |

3. Enter the new interface by clicking the Action icon (shown in the screen above); the screen shown below opens.

**Figure 10-17: Configuring WAN Ethernet**

**Configure WAN Ethernet 2**

|                                     |                                    |
|-------------------------------------|------------------------------------|
| <b>General</b>                      |                                    |
| Device Name:                        | eth0.300                           |
| Status:                             | Connected                          |
| Schedule:                           | Always                             |
| Network:                            | WAN                                |
| Connection Type:                    | Ethernet                           |
| Physical Address:                   | 00:90:8f:00:00:02                  |
| MTU:                                | Automatic 1500                     |
| Underlying Connection:              | WAN Ethernet                       |
| <b>Internet Protocol</b>            | No IP Address                      |
| <b>Internet Connection Firewall</b> | No IP Address                      |
| <b>Additional IP Addresses</b>      | Obtain an IP Address Automatically |
|                                     | Use the Following IP Address       |
|                                     | New IP Address                     |

OK

Apply

Cancel

4. Assign an IP address (static / DHCP) to the new interface. Configure the parameter 'Internet Protocol' to the Static IP option of 'Use the Following IP Address'; the screen shown below opens.

**Figure 10-18: Use the Following IP Address**

|                          |                              |
|--------------------------|------------------------------|
| <b>Internet Protocol</b> | Use the Following IP Address |
| IP Address:              | 1 . 1 . 1 . 1                |
| Subnet Mask:             | 255 . 0 . 0 . 0              |
| Default Gateway:         | 1 . 1 . 1 . 2                |
| DNS Server               |                              |

5. Define an IP address for each device and click Apply and OK.

## Changing the Routing Mode

### ➤ To change the routing mode:

1. (For all VOIP packets needing to be transferred within the VoIP VLAN) Open menu Network Connections > WAN Ethernet 2 > Settings; the figure shown below opens.

**Figure 10-19: Routing - Advanced**

|                                                   |            |
|---------------------------------------------------|------------|
| <b>Routing</b>                                    | Advanced ▾ |
| Routing Mode:                                     | NAPT ▾     |
| Device Metric:                                    | 3          |
| <input checked="" type="checkbox"/> Default Route |            |

2. In the Routing drop-down list, change the mode to 'Advanced'; extended parameters are displayed (refer to the figure below).

**Figure 10-20: Routing - Advanced - Extended Parameters**

|                                                             |            |
|-------------------------------------------------------------|------------|
| <b>Routing</b>                                              | Advanced ▾ |
| Routing Mode:                                               | Route ▾    |
| Device Metric:                                              | 3          |
| <input checked="" type="checkbox"/> Default Route           |            |
| <input type="checkbox"/> Multicast - IGMP Proxy Default     |            |
| <input type="checkbox"/> Routing Information Protocol (RIP) |            |

3. Configure parameter 'Routing Mode' (NAT or Route). Choose 'Route' and check the check box 'Default Route' in order to use the VoIP VLAN.
4. Configure 'Device Metric' to be the lower than the default metric (default = 3).

## Adding a Static Route

### ➤ To add a static route:

1. Open menu Advanced > Routing and click link 'New Route'; the screen shown below opens.

**Figure 10-21: Route Settings**

The 'Route Settings' dialog box features a green double-headed arrow icon. It contains the following fields:

- Name:** A drop-down menu currently showing 'WAN Ethernet'.
- Destination:** Four input boxes containing '11', '0', '0', and '0'.
- Netmask:** Four input boxes containing '255', '0', '0', and '0'.
- Gateway:** Four input boxes containing '11', '11', '11', and '1'.
- Metric:** A single input box containing '0'.

At the bottom are three buttons: 'OK' (with a green checkmark), 'Apply' (with a green arrow), and 'Cancel' (with a red X).

2. From the 'Name' drop-down list, choose 'WAN Ethernet'; configure the parameters Destination, Netmask and Gateway.

## Adding a Security Input Rule

### ➤ To add a security input rule:

1. Open menu Security > tab Advanced Filtering; the screen containing section 'Input Rule Sets' (shown below) opens.

**Figure 10-22: Input Rule Sets**

| Input Rule Sets                       |                |                     |                      |                                                                                              |        |
|---------------------------------------|----------------|---------------------|----------------------|----------------------------------------------------------------------------------------------|--------|
| Rule ID                               | Source Address | Destination Address | Protocols            | Operation                                                                                    | Status |
| Initial Rules                         |                |                     |                      |                                                                                              |        |
| WAN Ethernet Rules                    |                |                     |                      |                                                                                              |        |
| LAN Ethernet Rules                    |                |                     |                      |                                                                                              |        |
| WAN Ethernet 2 Rules                  |                |                     |                      |                                                                                              |        |
| WAN Ethernet 3 Rules                  |                |                     |                      |                                                                                              |        |
| <input checked="" type="checkbox"/> 0 | Any            | Any                 | HTTP - TCP Any -> 80 |  Reject | Active |
| New Entry                             |                |                     |                      |                                                                                              |        |
| WAN Ethernet 4 Rules                  |                |                     |                      |                                                                                              |        |
| Final Rules                           |                |                     |                      |                                                                                              |        |

2. Add a new entry for the interface; choose what the filter will be determined by (Source IP, Destination IP or Protocol). In the example shown in the figure below, Port 80 (HTTP) is rejected.

**Figure 10-23: Edit Advanced Filter**

 **Edit Advanced Filter**

**Matching**

**Source Address**

**Destination Address**

**Protocol**

| Name                                | Ports         | Action                                                                              |
|-------------------------------------|---------------|-------------------------------------------------------------------------------------|

| <input type="text" value="Add..."/> |               |                                                                                     |

**Operation**

☐ Drop 

☒ Reject   
Drop packets, and send TCP Reset or ICMP Host Unreachable packets to sender.

☐ Accept   
Accept all packets related to this session. This session is handled by Stateful Packet Tracking (SPI).

## Testing the 3-VLAN Setup

### ➤ To test the 3-VLAN setup:

1. Place a VOIP call. Verify that the VOIP is using 802.1q/p, that the VLAN ID is 300 and that the IP is 3.3.x.x (refer to the screen shown below).

**Figure 10-24: Testing the Setup**

| No. ↓                                                                         | Time      | Source  | Destination | Protocol | Info                     |
|-------------------------------------------------------------------------------|-----------|---------|-------------|----------|--------------------------|
| 37                                                                            | 10.242056 | 3.3.3.1 | 3.3.3.3     | RTP      | Payload type=ITU-T G.729 |

## 10.2 WAN-LAN Bridge

WAN bridge creates a bridge over WAN and LAN devices. In this way, PCs on the (ProductNameGeneric)'s LAN side can get IP addresses that are known on the WAN side.

### 10.2.1 Creation with the Connection Wizard

➤ **To configure an existing bridge or create a new one:**

1. Click the link 'New Connection' in the screen 'Network Connections'; the screen 'Connection Wizard' opens.
2. Select the radio button 'Advanced Connection' and click 'Next'; the screen 'Advanced Connection' opens.

3. Select the radio button 'Network Bridging' and click 'Next'; the screen 'Bridge Options' opens (refer to the figure below).

**Figure 10-27: Bridge Options**

4. Select whether to configure an existing bridge (this option will only appear if a bridge exists) or to add a new one:

1. **Configure Existing Bridge**  
Select this option and click 'Next'; the screen 'Network Bridging' opens (refer to the figure below) allowing you to add new connections or remove existing ones, by checking or unchecking their respective check boxes.

**Figure 10-28: Network Bridging**

The 'Network Bridging' window shows a table of 'Bridged Connections'. The table has two columns: 'Name' and 'Status'. The first row is 'Bridge' with status 'Up'. The second row is 'WAN Ethernet' with status 'Connected' and an unchecked checkbox. The third row is 'LAN Ethernet' with status 'Disconnected' and a checked checkbox. The fourth row is 'WAN Ethernet 2' with status 'Connected' and a checked checkbox. At the bottom are three buttons: '< Back', 'Next >', and 'X Cancel'.

| Name                                               | Status       |
|----------------------------------------------------|--------------|
| Bridge                                             | Up           |
| <input type="checkbox"/> WAN Ethernet              | Connected    |
| <input checked="" type="checkbox"/> LAN Ethernet   | Disconnected |
| <input checked="" type="checkbox"/> WAN Ethernet 2 | Connected    |

For example, checking the WAN check box will create a LAN-WAN bridge.

2. **Add a New Bridge**  
Select this option and click 'Next'; a different 'Network Bridging' screen opens (refer to the figure below) allowing you to add a bridge over the unbridged connections, by checking their respective check boxes.

**Figure 10-29: WLAN-LAN - Network Bridging**

The 'WLAN-LAN - Network Bridging' window shows a table of 'Bridged Connections'. The table has two columns: 'Name' and 'Status'. The first row is 'WAN Ethernet' with status 'Connected' and an unchecked checkbox. The second row is 'LAN Ethernet' with status 'Disconnected' and a checked checkbox. The third row is 'WAN Ethernet 2' with status 'Up' and a checked checkbox. At the bottom are three buttons: '< Back', 'Next >', and 'X Cancel'.

| Name                                               | Status       |
|----------------------------------------------------|--------------|
| <input type="checkbox"/> WAN Ethernet              | Connected    |
| <input checked="" type="checkbox"/> LAN Ethernet   | Disconnected |
| <input checked="" type="checkbox"/> WAN Ethernet 2 | Up           |

Important notes:

- The same connections cannot be shared by two bridges.
  - A bridge cannot be bridged.
  - Bridged connections will lose their IP settings.
1. Click 'Next'; the screen 'Connection Summary' opens (refer to the figure below), corresponding to your changes.

**Figure 10-30: Connection Summary - Configure Existing Bridge**

2. Check the check box 'Edit the Newly Created Connection' to be routed to the new connection's configuration screen after clicking 'Finish'.
3. Click 'Finish' to save the settings; the new bridge is added to the network connections list; it's configurable like any other bridge.

## 10.2.2 General

Refer to 'General' on page [100](#).

## 10.2.3 Internet Protocol Settings

Refer to 'Internet Protocol Settings' on page [75](#)

### 10.2.4 Bridge Settings

The bridge section allows you to specify the LAN and WAN devices that you would like to join under the network bridge. Click the icon 'Edit' on the VLAN column to assign the network connections to specific Virtual LANS. Select the check box 'STP' to enable the Spanning Tree Protocol on the device. You should use this to ensure that there are no loops in your network configuration, and apply these settings if your network consists of multiple switches, or other bridges apart from those created by the Telephone Adapter.

**Figure 10-31: Bridge Settings**

| Bridge                                                                                                                               |  |                                                                                              |              |

|  Bridge                                             |  | Disabled  | Up           |
| <input type="checkbox"/>  WAN Ethernet              |  |                                                                                              | Connected    |
| <input checked="" type="checkbox"/>  LAN Ethernet   |  | Disabled  | Disconnected |
| <input checked="" type="checkbox"/>  WAN Ethernet 2 |  | Disabled  | Connected    |

## 10.2.5 Examples of Configuring VLANs in Bridge Mode

### 10.2.5.1 Example 1 - Configuring 3 VLANs: VoIP, Data and Management

This example explains how to configure the MP-202 to use 3 separate VLANs (for VOIP, data and management) in bridge mode.

**Figure 10-32: Example of Using Bridge Mode and Configuring VLANs**

## Setup

Two MP-202s are connected to the switch. Both are configured to use VLAN 200 for VOIP, VLAN 300 for Data and VLAN 400 for Management. Three DHCP servers are connected to the same switch (optional; you can use a static IP address for each VLAN). One uses VLAN 200, the second, VLAN 300, and the third, VLAN 400.

### ➤ To configure 3 separate VLANs in bridge mode:

1. (For MP202-1 & MP202-2; refer to the figure above) Connect the PC to MP202-1 LAN NIC and use static IP address 192.168.2.10 for your PC.
2. In Internet Explorer, browse to <http://192.168.2.1>

3. Open menu Advanced > Remote Administration. Check the check boxes 'Using Primary HTTP Port (80)' and 'Allow Incoming ICMP Echo Requests' (to allow HTTP and ICMP from the WAN interface)
4. For data, configure VLAN ID 300 and then configure it to 'Obtain IP Address Automatically' (refer to the figure below) (optionally, you can use a static IP address).

Figure 10-33: Network Connections

| Network Connections |           |        |
|---------------------|-----------|--------|
| Name                | Status    | Action |
| WAN Ethernet        | Connected |        |
| WAN Ethernet 2      | Connected |        |
| Bridge              | Up        |        |
| New Connection      |           |        |

Quick Setup   Status   Advanced >>

5. For VOIP, configure VLAN ID 200 and then configure it to 'Obtain IP Address Automatically' (optionally, you can use a static IP address).
6. For management, configure VLAN ID 400 and then configure it to 'Obtain IP Address Automatically' (optionally, you can use a static IP address). The figure below shows how to obtain DHCP on the interface.

Figure 10-34: Configuring WAN Ethernet

**Configure WAN Ethernet 2**

|                                     |                   |

7. Define a new network bridge. Define a network bridge by checking the check boxes of LAN Ethernet and WAN Ethernet 3 (VLAN Interface 300) in the screen 'Network Bridging' under 'Bridged Connections' (refer to the figure below).

**Figure 10-35: Network Bridging**

Configure your bridge properties:

**Bridged Connections**

| Name                                               | Status    |
|----------------------------------------------------|-----------|
| <input type="checkbox"/> WAN Ethernet              | Connected |
| <input checked="" type="checkbox"/> LAN Ethernet   | Connected |
| <input type="checkbox"/> WAN Ethernet 2            | Connected |
| <input checked="" type="checkbox"/> WAN Ethernet 3 | Connected |

< Back    Next >    X Cancel

8. Set the bridge to use 'No IP Address'. Click Apply and OK and then click OK again.

**Figure 10-36: No IP Address**

**Internet Protocol**

☐ Override Subnet Mask:

- No IP Address
- Obtain an IP Address Automatically
- Use the Following IP Address

Renew    Release

9. Reboot the MP-202 (optional).
10. Ensure that the PC is connected to the LAN port of the MP-202 and then configure it to 'Obtain IP Address Automatically'; all data from the LAN port will be in VLAN 300.
11. To access the web from the WAN, you must be in VLAN 400 and use the VLAN 400 IP address.

12. To access the web from the LAN, set your PC to a static IP address 192.168.2.2-254; the figure below shows the System Monitoring screen.

**Figure 10-37: System Monitoring**

The screenshot shows the 'System Monitoring' interface with a navigation bar at the top containing 'Connections', 'Traffic', 'System Log', 'System', and 'Voice Over IP'. The 'Connections' tab is selected, displaying a table of network connections. At the bottom of the table are three buttons: 'Close', 'Automatic Refresh Off', and 'Refresh'.

| Name                    | WAN Ethernet           | LAN Ethernet      | WAN Ethernet 2    | WAN Ethernet 3    | Bridge                         |
|-------------------------|------------------------|-------------------|-------------------|-------------------|--------------------------------|

### Testing the Setup

13. Place a VOIP call and see that the VOIP is using 802.1q/p and that the VID is 200.
14. Ping from the PC (behind MP202-1) to the network; you'll see that the data traffic is using 802.1q and that the VID is 300.
15. Connect a PC to the network in VLAN 400; verify that you can access VLAN 400 from the WAN interface.

### 10.2.5.2 Example 2 - Configuring Tagged VoIP, Untagged Data Traffic

This example explains how to configure the MP-202 to tag VoIP traffic and untag data traffic in bridge mode.

**Figure 10-38: Example of Tagging Voice and Untagging Data**

#### Setup

Two MP-202s are connected to the switch. Both are configured to use VLAN 200 for VoIP and non-VLAN traffic for data. Two DHCP servers are connected to the same switch. One is in a VLAN 200 network; the other is in a non-VLAN network.

#### ➤ To configure tagging for VoIP and untagging for data in bridge mode:

##### For MP202-1 and MP202-2

1. Connect the PC to the LAN NIC and use static IP address 192.168.2.2-254 for your PC.
2. In Internet Explorer, browse to <http://192.168.2.1>
3. Open menu Advanced > Remote Administration. Check the check boxes 'Using Primary HTTP Port (80)' and 'Allow Incoming ICMP Echo Requests' (to allow HTTP and ICMP from the WAN interface)

4. Add a network bridge: In the screen 'Network Bridging', check LAN Ethernet and WAN Ethernet (refer to the figure below).

**Figure 10-39: WAN/LAN Bridge**

The 'Network Bridging' screen shows a table of bridged connections. Both 'WAN Ethernet' and 'LAN Ethernet' are checked and listed as 'Connected' and 'Disconnected' respectively. Navigation buttons for '< Back', 'Next >', and 'Cancel' are at the bottom.

**Network Bridging**

Configure your bridge properties:

**Bridged Connections**

| Name                                             | Status       |
|--------------------------------------------------|--------------|
| <input checked="" type="checkbox"/> WAN Ethernet | Connected    |
| <input checked="" type="checkbox"/> LAN Ethernet | Disconnected |

< Back   Next >   Cancel

5. For VoIP, add VLAN Interface 200 (VID 200) and choose option 'Bridge' in the drop-down list of parameter 'Underlying Device' (refer to the figure below).

**Figure 10-40: VLAN Interface Screen**

The 'VLAN Interface' screen shows a dropdown menu for 'Underlying Device' with options 'WAN Ethernet', 'LAN Ethernet', and 'Bridge'. The 'Bridge' option is selected. Navigation buttons for '< Back', 'Next >', and 'Cancel' are at the bottom.

**VLAN Interface**

Configure new VLAN interface:

Underlying Device: WAN Ethernet

VLAN ID:

< Back   Next >   Cancel

6. Set the bridge interface: In the 'Bridge' section of the Network Connection screen, edit the 'Bridge' and 'WAN' interfaces to enable VLAN for all VLAN IDs (refer to the screen below).

**Figure 10-41: Bridge Section of the Screen**

| Bridge                                                                                                                             |          |                                                                                              |                          |
|------------------------------------------------------------------------------------------------------------------------------------|----------|----------------------------------------------------------------------------------------------|--------------------------|
| Name                                                                                                                               | VLANs    | Status                                                                                       | STP                      |
|  Bridge                                           | Disabled |  Connected |                          |
| <input checked="" type="checkbox"/>  WAN Ethernet | Disabled |  Connected | <input type="checkbox"/> |
| <input checked="" type="checkbox"/>  LAN Ethernet | Disabled |  Connected | <input type="checkbox"/> |
| <input type="checkbox"/>  WAN Ethernet 2          |          | Connected                                                                                    | <input type="checkbox"/> |

Close Automatic Refresh Off Refresh

## Testing the Setup

1. Place a VoIP call and verify that VOIP is using 802.1q/p and that the VID is 200.

**Figure 10-46: Testing the Setup**

The screenshot shows a Wireshark capture of a VoIP call setup. The filter is set to 'vlan'. The packet list shows several packets, including BOOTP requests and SIP messages. The packet details pane shows the structure of a frame 88, which is an Ethernet II frame with a source MAC of 38:3c:d8:06:5e:33 and a destination MAC of 00:90:8f:09:ef:93. The frame contains an 802.1q Virtual LAN tag with a priority of 0, CFI of 0, and an ID of 200. The payload is an IP packet from 1.1.1.14 to 1.1.1.12, which contains a User Datagram Protocol (UDP) packet from port 5060 to port 5060, and a Session Initiation Protocol (SIP) message.

| No. | Time      | Source   | Destination     | Protocol | Info                                                                 |

2. Ping from the PC (connected to the LAN port of the MP-202) and verify that the data traffic (ICMP) is untagged (refer to the screen below).

**Figure 10-47: Testing the Setup**

The screenshot shows a Wireshark capture of a ping request. The filter is set to 'icmp'. The packet list shows several ICMP Echo (ping) request and reply packets. The packet details pane shows the structure of frame 36, which is an Ethernet II frame with a source MAC of 00:90:8f:06:7e:ca and a destination MAC of 00:17:a4:40:fe:34. The frame contains an Internet Protocol (IP) packet from 10.33.4.166 to 10.33.2.3, which contains an Internet Control Message Protocol (ICMP) Echo (ping) request.

| No. | Time      | Source      | Destination | Protocol | Info                |
|-----|-----------|-------------|-------------|----------|---------------------|

### 10.2.5.3 Example 3 - Configuring VoIP and Data in the Same VLAN

#### ➤ To configure VoIP and data in the same VLAN:

1. For VoIP and data, configure a VLAN ID and then configure each to 'Obtain IP Address Automatically' (refer to the figure below) (optionally, you can use a static IP address).

Figure 10-48: Configuring VoIP and Data in the Same VLAN

 **Configure WAN Ethernet 2**

|                                     |                                                                                      |
|-------------------------------------|--------------------------------------------------------------------------------------|
| <b>General</b>                      |                                                                                      |
| Device Name:                        | eth0.300                                                                             |
| Status:                             | Connected                                                                            |
| Schedule:                           | Always                                                                               |
| Network:                            | VLAN ▾                                                                               |
| Connection Type:                    | Ethernet                                                                             |
| Physical Address:                   | 00:90:8f:00:00:02                                                                    |
| MTU:                                | Automatic ▾ 1500                                                                     |
| Underlying Connection:              | WAN Ethernet                                                                         |
| <b>Internet Protocol</b>            | No IP Address ▾                                                                      |
| <b>Internet Connection Firewall</b> | No IP Address                                                                        |
| <b>Additional IP Addresses</b>      | Obtain an IP Address Automatically<br>Use the Following IP Address<br>New IP Address |

2. Define a new network bridge. Define it by checking the check boxes of LAN Ethernet and the new VLAN Interface that you defined (refer to the figure below).

Figure 10-49: VoIP and Data on same VLAN

 **Network Bridging**

Configure your bridge properties:

**Bridged Connections**

| Name                                               | Status       |
|----------------------------------------------------|--------------|
| <input type="checkbox"/> WAN Ethernet              | Connected    |
| <input checked="" type="checkbox"/> LAN Ethernet   | Disconnected |
| <input checked="" type="checkbox"/> WAN Ethernet 2 | Connected    |

3. Go to the regular WAN and change the mode to 'No IP Address'

**Figure 10-50: No IP Address**

| Internet Protocol                              |                                      |
|------------------------------------------------|--------------------------------------|
| <input type="checkbox"/> Override Subnet Mask: | Obtain an IP Address Automatically ▼ |
|                                                | No IP Address                        |
|                                                | Obtain an IP Address Automatically   |
|                                                | Use the Following IP Address         |
| DHCP Lease:                                    | <div>Renew</div> <div>Release</div>  |

If your configuration is correct, all data from the LAN and VoIP should be sent in the same VLAN.

# 11 TR-069 CPE WAN Management Protocol

## 11.1 Overview

TR-069 is a WAN management protocol intended for communication between Customer Premise Equipment (CPE) or residential devices (such as the MP-202), and an Auto-Configuration Server (ACS). It defines a mechanism that encompasses secure auto configuration of CPE, and also incorporates other CPE management functions into a common framework.

In simpler terms, TR-069 is a protocol that enables remote server management of the MP-202. Such a protocol is useful, for example, for remotely and securely controlling the MP-202 by the CPE provider.

Figure 11-1: TR-069 CPE WAN Management Protocol

The TR-069 protocol allows an ACS to provision a CPE or collection of CPE based on a variety of criteria. The provisioning mechanism includes specific provisioning parameters and a general mechanism for adding vendor-specific provisioning capabilities as needed. The provisioning mechanism allows CPE provisioning at the time of initial connection to the broadband access network, and the ability to re-provision at any subsequent time. This includes support for asynchronous ACS-initiated re-provisioning of CPE. TR-069 defines several Remote Procedure Call (RPC) methods, as well as a large number of parameters, which may be set or read. Some of these methods and parameters are defined as mandatory. TR-098 is the DSLHome Internet Gateway Device Version 1.1 Data Model for TR-069.

## 11.2 TR-069 Parameter List

The DSL Forum TR-069 Technical Report species the TR-069 full parameter list, including the parameter type and description. For further information, refer to [http://www.dslforum.org/aboutdsl/Technical\\_Reports/TR-069.pdf](http://www.dslforum.org/aboutdsl/Technical_Reports/TR-069.pdf)

Following is the list of the TR-069 objects supported by the MP-202. Objects that are partly supported have a detailed list of their implemented parameters. If not specified, the listed object is fully implemented.

- InternetGatewayDevice.
- InternetGatewayDevice.ManagementServer.
  - URL

- Username
- Password
- PeriodicInformEnable
- PeriodicInformInterval
- PeriodicInformTime
- ParameterKey
- ConnectionRequestURL
- ConnectionRequestUsername
- ConnectionRequestPassword
- InternetGatewayDevice.DeviceInfo.
  - Manufacturer
  - ManufacturerOUI
  - ModelName
  - Description
  - Product Class
  - SerialNumber
  - HardwareVersion
  - SoftwareVersion
  - SpecVersion
  - ProvisioningCode
  - UpTime
  - DeviceLog
- InternetGatewayDevice.LANDevice.{i}
- InternetGatewayDevice.LANDevice.{i}.LANHostCongManagement.
  - DHCPSEnable
  - MinAddress
  - MaxAddress
  - SubnetMask
  - DNSServers
- InternetGatewayDevice.LANDevice.{i}.Hosts.
- InternetGatewayDevice.LANDevice.{i}.Hosts.Host.{i}.
  - IPAddress
  - AddressSource
  - MACAddress
  - HostName
  - InterfaceType
- InternetGatewayDevice.LANDevice.{i}.LANEthernetInterfaceConfig.{i}.

- Status
- MACAddress
- MaxBitRate
- InternetGatewayDevice.LANDevice.{i}.LANEthernetInterfaceConfig. {}.Stats.
- InternetGatewayDevice.WANDevice.{i}.
- InternetGatewayDevice.WANDevice.{i}.WANCommonInterfaceConfig.
  - EnabledForInternet
  - WANAccessType
  - Layer1UpstreamMaxBitRate
  - Layer1DownstreamMaxBitRate
  - PhysicalLinkStatus
  - TotalBytesSent
  - TotalBytesReceived
  - TotalPacketsSent
  - TotalPacketsReceived
- InternetGatewayDevice.WANDevice.{i}.WANDSLConnectionManagement.
- InternetGatewayDevice.WANDevice.{i}.WANDSLConnectionManagement.ConnectionService.{i}.
- InternetGatewayDevice.WANDevice.{i}.WANConnectionDevice.{i}.
- InternetGatewayDevice.WANDevice.{i}.WANConnectionDevice.{i}.
  - WANDSLLinkCong.
  - Enable
  - LinkStatus
  - LinkType
  - AutoCong
  - DestinationAddress
  - ATMTransmittedBlocks
  - ATMReceivedBlocks
- InternetGatewayDevice.WANDevice.{i}.WANConnectionDevice.{i}.
  - WANPPPPConnection.{i}.
  - Enable
  - ConnectionStatus
  - ConnectionType
  - Name
  - Uptime
  - Username

- Password
- ExternalIPAddress
- DNSServers
- TransportType
- PPPoEACName
- PPPoEServiceName

The MP-202 supports the following Remote Procedure Calls (RPCs):

- GetRPCMethods
- SetParameterValues
- GetParameterValues
- GetParameterNames
- SetParameterAttributes
- GetParameterAttributes
- AddObject
- DeleteObject
- Download
- Reboot

Note that the implementation of SetParameterAttributes is empty; MP-202 does not implement access control nor notifications as defined in the specification.

## 11.2.1 Viewing, Changing TR-069 Parameters Using the CLI

TR-069 parameters can be viewed and configured via the CLI. This section presents a specific example of how to view and change TR-069 parameters. Use the example as a guide.

### ➤ To run CLI commands:

4. Open Telnet
5. Access the system from a PC connected to the LAN port of the MP-202 Telnet 192.168.2.1
6. Enter the administrator user and password.

### ➤ To view the current TR-069 settings, run these commands:

```
rg_conf_print manufacturer/vendor_name
rg_conf_print manufacturer/vendor_oui
rg_conf_print manufacturer/product_class
rg_conf_print manufacturer/model_number
rg_conf_print manufacturer/hardware/serial_num
rg_conf_print cwmp/acs_url
rg_conf_print cwmp/username
rg_conf_print_obscure cwmp/password
rg_conf_print cwmp/conn_req_username
rg_conf_print_obscure cwmp/conn_req_password
```

➤ **To change a TR-069 parameter, use the following API:**

```
rg_conf_set manufacturer/vendor_name CompanyName
rg_conf_set manufacturer/vendor_oui (Organizationally Unique
Identifier; OUI is 00908F)
rg_conf_set manufacturer/product_class MP-20X
rg_conf_set manufacturer/model_number MP-202
rg_conf_set manufacturer/hardware/serial_num 123456
rg_conf_set cwmp/acs_url http://acsurl.com
rg_conf_set cwmp/username cpe
rg_conf_set_obscure cwmp/password 123456
rg_conf_set cwmp/conn_req_username acl
rg_conf_set_obscure cwmp/conn_req_password 123
```

➤ **If a parameter is changed, activate the following CLI commands:**

```
rg_conf_set cwmp/enabled 1
reconf 1
```

➤ **To stop and restart the TR-69 client, use the following CLI commands:**

```
cwmp_session_start
cwmp_session_stop
```

**Table 11-1: TR-069 Parameter Descriptions**

| Name         | Type       | Description                                                                                                                                                                                                                    |
|--------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Manufacturer | string(64) | Manufacturer of the device (for display only).                                                                                                                                                                                 |
| OUI          | string(6)  | Organizationally unique identifier of the device manufacturer. Represented as a six hexadecimal-digit value using all upper-case letters and including any leading zeros. The value MUST be a valid OUI.                       |
| ProductClass | string(64) | Identifier of the class of product for which the serial number applies. That is, for a given manufacturer, this parameter is used to identify the product or class of product over which the SerialNumber parameter is unique. |
| SerialNumber | string(64) | Identifier of the particular device that is unique for the indicated class of product and manufacturer.                                                                                                                        |

## 12 Security

The MP-202's security suite includes comprehensive and robust security services: Stateful Packet Inspection Firewall, user authentication protocols and password protection mechanisms. These features together allow users to connect their computers to the Internet and simultaneously be protected from the security threats of the Internet.

The firewall, which is the cornerstone of your Telephone Adapter's security suite, has been exclusively tailored to the needs of the residential/office user and has been pre-configured to provide optimum security (refer to the figure below).

**Figure 12-1: Firewall in Action**

The MP-202 firewall provides both the security and flexibility that home and office users seek. It provides a managed, professional level of network security while enabling the safe use of interactive applications, such as Internet gaming and video-conferencing.

Additional features, including surfing restrictions and access control, can also be easily configured locally by the user through a user-friendly Web-based interface, or remotely by a service provider.

The MP-202 firewall supports advanced filtering, designed to allow comprehensive control over the firewall's behavior. You can define specific input and output rules, control the order of logically similar sets of rules and make a distinction between rules that apply to WAN and LAN network devices.

The Web-based management screens in the Security section feature the following:

- The 'General' screen allows you to choose the security level for the firewall (refer to 'General Security Level Settings' on page [138](#))
- The 'Access Control' screen can be used to restrict access from the home network to the Internet (refer to 'Local Servers (Port Forwarding)' on page [142](#)).
- The 'Port Forwarding' screen can be used to enable access from the Internet to specified services provided by computers in the home network and special Internet applications (refer to Port Forwarding on page [142](#))
- The 'DMZ Host' screen allows you to configure a LAN host to receive all traffic arriving at your Telephone Adapter, which does not belong to a known session (refer to 'Port Triggering' on page [147](#)).
- The 'Port Triggering' screen allows you to define port triggering entries, to dynamically open the firewall for some protocols or ports. (refer to 'Remote Administration' on page [167](#)).
- The 'Website Restrictions' allows you to block LAN access to a certain host or web

site on the Internet. (refer to Website Restrictions on page 151).

- 'Advanced Filtering' allows you to implicitly control the firewall setting and rules (refer to 'Advanced Filtering' on page 154).
- 'Security Log' allows you to view and configure the firewall Log (refer to Security Log on page 159).

## 12.1 General Security Level Settings

Use the 'Security Settings' screen to configure the Telephone Adapter's basic security settings (refer to the figure below).

**Figure 12-2: General Security Level Settings**

The firewall regulates the flow of data between the home network and the Internet. Both incoming and outgoing data are inspected and then either accepted (allowed to pass through the MP-202) or rejected (barred from passing through the MP-202) according to a flexible and configurable set of rules. These rules are designed to prevent unwanted intrusions from the outside, while allowing home users access to the Internet services that they require.

The firewall rules specify what types of services available on the Internet may be accessed from the home network and what types of services available in the home network may be accessed from the Internet. Each request for a service that the firewall receives, whether originating in the Internet or from a computer in the home network, is checked against the set of firewall rules to determine whether the request should be allowed to pass through the firewall. If the request is permitted to pass, then all subsequent data associated with this request (a "session") will also be allowed to pass, regardless of its direction.

For example, when you point your Web browser to a Web page on the Internet, a request is sent out to the Internet for this page. When the request reaches the MP-202, the firewall will identify the request type and origin--HTTP and a specific PC in your home network, in this case. Unless you have configured access control to block requests of this type from this computer, the firewall will allow this request to pass out onto the Internet (refer to 'WAN PPPoE' on page 78 for more on setting access controls). When the Web page is returned from the Web server the firewall will associate it with this session and allow it to pass, regardless of whether HTTP access from the Internet to the home network is blocked or permitted.

Note that it is the *origin of the request*, not subsequent responses to this request, that determines whether a session can be established or not.

You can choose from among three pre-defined security levels for the MP-202: Minimum, Typical, and Maximum (the default setting). The table below summarizes the behavior of the MP-202 for each of the three security levels.

**Table 12-1: Behavior for the Three Security Levels**

| Security Level                    | Requests Originating in the WAN (Incoming Traffic)                                                                              | Requests Originating in the LAN (Outgoing Traffic)                                          |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <b>Maximum Security (Default)</b> | Blocked: No access to home network from Internet, except as configured in the Local Servers, DMZ host and Remote Access screens | Limited: Only commonly-used services, such as Web-browsing and e-mail, are permitted        |
| <b>Typical Security</b>           | Blocked: No access to home network from Internet, except as configured in the Local Servers, DMZ host and Remote Access screens | Unrestricted: All services are permitted, except as configured in the Access Control screen |
| <b>Minimum Security</b>           | Unrestricted: Permits full access from Internet to home network; all connection attempts permitted.                             | Unrestricted: All services are permitted, except as configured in the Access Control screen |

These services include Telnet, FTP, HTTP, HTTPS, DNS, IMAP, POP3 and SMTP.

The list of allowed services at 'Maximum Security' mode can be edited in the screen 'Access Control' on page 140.

Some applications (such as some Internet messengers and Peer-To-Peer client applications) tend to use these ports if they cannot connect with their own default ports. When applying this behaviour, these applications will not be blocked outbound, even at Maximum Security Level.

### ➤ To configure the MP-202's security settings:

(Refer to the figure 'General Security Level Settings')

1. Choose from among the three predefined security levels described in the table above. 'Maximum Security' is the default setting.

**Using the Minimum Security setting may expose the home network to significant security risks, and thus should only be used, when necessary, for short periods of time.**

2. Check the 'Block IP Fragments' box in order to protect your home network from a common type of hacker attack that could make use of fragmented data packets to sabotage your home network. Note that VPN over IPSec and some UDP-based services make legitimate use of IP fragments. You will need to allow IP fragments to pass into the home network in order to make use of these select services.
3. Click 'OK' to save the changes.

## 12.2 Access Control

You may want to block specific computers within the home network (or even the whole network) from accessing certain services on the Internet. For example, you may want to prohibit one computer from surfing the Web, another computer from transferring files using FTP, and the whole network from receiving incoming e-mail.

Access Control defines restrictions on the types of requests that may pass from the home network out to the Internet, and thus may block traffic flowing in both directions. In the e-mail example given above, you may prevent computers in the home network from receiving e-mail by blocking their *outgoing* requests to POP3 servers on the Internet.

There are services you should consider blocking, such as popular game and file sharing servers. For example, to ensure that your employees do not put your business at risk from illegally traded copyright files, you may want to block several popular P2P and file sharing applications.

### ➤ To view and allow/restrict these services:

1. In the 'Security' screen (refer to the figure above), click tab 'Access Control'; the screen 'Access Control' opens (refer to the figure below).

**Figure 12-3: Access Control**

| Local Host | Local Address | Protocols | Status | Action                                                                                |
|------------|---------------|-----------|--------|---------------------------------------------------------------------------------------|
| New Entry  |               |           |        |  |

2. Click the link 'New Entry'; the screen 'Add Access Control Rule' opens (refer to the figure below).

**Figure 12-4: Add Access Control Rule**

| Add Access Control Rule                                                 |        |
|-------------------------------------------------------------------------|--------|
| Address                                                                 | Any    |
| Protocol                                                                | Any    |
| Schedule                                                                | Always |
| <input type="button" value="OK"/> <input type="button" value="Cancel"/> |        |

3. The parameter 'Address' enables you to specify the computer or group of computers for which you would like to apply the access control rule. You can select between any or a specific computer address in your LAN. If you choose the 'Specify Address' option, the screen will refresh, and an 'Add' link appears. Click it to specify a computer address. Specify an address by creating a 'Network Object'.
4. The parameter 'Protocol' lets you select or specify the type of protocol to be used. In addition to the list of popular protocols it provides, you may also choose any or a specific protocol. If you choose option 'Specify Protocol', the screen refreshes and an 'Add' link appears. Click it to specify a protocol address.
5. The parameter 'Schedule' allows you to define the time period during which this rule will take effect. You can select between 'Always' or a specific schedule. If you choose the option 'Specify Schedule', the screen refreshes and an 'Add' link appears. Click it to specify a schedule.
6. Click OK to save your settings; the 'Access Control' screen displays a summary of the rule that you just added. Click 'Edit' to edit the access control rule for the service; the screen 'Edit Service' opens.
7. Select the network group to which you would like to apply the rule and the schedule during which the rule will take effect.
8. Click 'OK' to save your changes and return to the 'Access Control' screen.

You can disable an access control rule and make the service available without having to remove the service from 'Access Control'. This can be useful when making the service only temporarily available and when expecting to reinstate the restriction in the future.

- To temporarily disable rule, clear the check box adjacent to the service name.
- To reinstate the restriction at a later time, recheck it.
- To remove a rule, click the action icon 'Remove' for the service; the service is removed from 'Access Control'.

**Note:** When Web Filtering is enabled, HTTP services cannot be blocked by Access Control.

## 12.3 Port Forwarding

In its default state, the gateway blocks all external users from connecting to or communicating with your network. Therefore the system is safe from hackers who may try to intrude on the network and damage it. However, you may want to expose your network to the Internet in certain limited and controlled ways in order to enable some applications to work from the LAN (game, voice and chat applications, for example) and to enable Internet-access to servers in the home network. The Port Forwarding feature supports both of these functionalities.

The 'Port Forwarding' screen lets you define the applications that require special handling by the gateway. You must select the application's protocol and the local IP address of the computer that will be using or providing the service. If required, you can add new protocols in addition to the most common ones provided by the gateway.

For example, to use an FTP application on one of your PCs, select 'FTP' from the list and enter the local IP address or host name of the designated computer; all FTP-related data arriving at the gateway from the Internet is then forwarded to the specified computer.

Similarly, to grant Internet users access to servers inside your home network, you must identify each service that you want to provide and the PC that will provide it. For example, to host a Web server inside the home network you must select 'HTTP' from the list of protocols and enter the local IP address or host name of the computer that will host the Web server. When an Internet user points her browser to the external IP address of the gateway, it forwards the incoming HTTP request to the computer that is hosting the Web server.

Additionally, port forwarding enables you to redirect traffic to a different port instead of the one to which it was designated. If for example you have a Web server running on your PC on port 8080 and you want to grant access to this server to anyone who accesses the gateway via HTTP, do the following:

- Define a port forwarding rule for the HTTP service, with the PC's IP or host name.
- Specify 8080 in the field 'Forward to Port'.

All incoming HTTP traffic will now be forwarded to the PC running the Web server on port 8080.

When setting a port forwarding service, you must ensure that the port is not already in use by another application, which may stop functioning. A common example is when using SIP signaling in Voice over IP - the port used by the gateway's VoIP application (5060) is the same port on which port forwarding is set for LAN SIP agents.

**Note:** Some applications, such as FTP, TFTP, PPTP and H323, require the support of special specific Application Level Gateway (ALG) modules in order to work inside the home network. Data packets associated with these applications contain information that allows them to be routed correctly. An ALG is needed to handle these packets and ensure that they reach their intended destinations. OpenRG is equipped with a robust list of ALG modules in order to enable maximum functionality in the home network. The ALG is automatically assigned based on the destination port.

➤ **To add a new port forwarding service:**

1. Select the tab 'Port Forwarding' in the screen 'Security'; the screen 'Port Forwarding' opens (refer to the figure).

**Figure 12-5: Port Forwarding**

OK Apply Cancel Resolve Now Refresh

2. Click the link 'New Entry'; the screen 'Add Port Forwarding Rule' opens (refer to the figure).

**Figure 12-6: Add Port Forwarding Rule**

### Add Port Forwarding Rule

|                  |                                                            |
|------------------|------------------------------------------------------------|
| Local Host:      | <input style="width: 60%;" type="text"/>                   |
| <b>Protocol</b>  | Any <span style="float: right;">▼</span>                   |
| Forward to Port: | Same as Incoming Port <span style="float: right;">▼</span> |
| <b>Schedule</b>  | Always <span style="float: right;">▼</span>                |

✓ OK
✗ Cancel

3. Enter the IP address or the host name of the computer that will provide the service (the 'server'). Note that only one LAN computer can be assigned to provide a specific service or application.

The Protocol combo box lets you select or specify the type of protocol that will be used. In addition to the list of popular protocols it provides, you may also choose any or a specific protocol. If you choose the option 'Specify Protocol', the screen refreshes and an 'Add' link appears:

**Figure 12-7: Add a Specific Protocol**

|                 |                                                       |            |
|-----------------|-------------------------------------------------------|------------|
| <b>Protocol</b> | Specify Protocol <span style="float: right;">▼</span> | <b>Add</b> |
|-----------------|-------------------------------------------------------|------------|

4. Click the link 'Add' to specify a protocol; by default, the gateway forwards traffic to the same port as the incoming port. To redirect traffic to a different port, select the option 'Specify'; the screen refreshes and an additional field appears, enabling you to enter the port number:

**Figure 12-8: Forward to a Specific Port**

|                  |                                              |                                          |
|------------------|----------------------------------------------|------------------------------------------|
| Forward to Port: | Specify <span style="float: right;">▼</span> | <input style="width: 60%;" type="text"/> |
|------------------|----------------------------------------------|------------------------------------------|

5. To define the time period during which this rule will take effect, select The in the drop-down list 'Schedule' between 'Always' or a specific schedule. If you choose the option 'Specify Schedule', the screen refreshes and an 'Add' link appears:

Figure 12-9: Add a Specific Schedule

**Schedule**  

8. Click 'OK' to save your changes and return to the screen 'Port Forwarding'.
9. You can disable a port forwarding rule to make a service unavailable without having to remove the rule from the screen 'Port Forwarding'. This can be useful when making the service temporarily unavailable and when expecting to reinstate it in the future.
  - To temporarily disable a rule, clear the check box next to the service name.
  - To reinstate it at a later time, reselect the check box.
  - To remove a rule, click the action icon 'Remove' for the service; the service is permanently removed.

How many computers can use a service or play a game simultaneously? All computers on the network can use a specific service as clients simultaneously. Being a client means that the computer within the network initiates the connection - for example, opens an FTP connection with an FTP server on the Internet. But only one computer can serve as a server, meaning responding to requests from computers on the Internet. Assigning a specific computer as a server is done in the Port Forwarding section of Web-based management.

## 12.4 DMZ Host

The DMZ (Demilitarized) Host feature allows one local computer to be exposed to the Internet.

Designate a DMZ host to:

- Use a special-purpose Internet service, such as an on-line game or video-conferencing program, that is not present in the Local Servers list and for which no port range information is available.
- To expose one computer to all services, without restriction, irrespective of security.

**Warning:** A DMZ host is not protected by the firewall and may be vulnerable to attack. Designating a DMZ host may also put other computers in the home network at risk. When designating a DMZ host, you must consider the security implications and protect it if necessary.

An incoming request for access to a service in the home network, such as a Web-server, is fielded by the MP-202. The MP-202 will forward this request to the DMZ host (if one is designated) unless the service is being provided by another PC in the home network (assigned in Local Servers), in which case that PC will receive the request instead.

➤ **To designate a local computer as a DMZ Host:**

1. Click tab 'DMZ Host'; the screen 'DMZ Host' opens (refer to the figure).

**Figure 12-12: DMZ Host**

2. Enter the local IP address of the computer to be designated as a DMZ host. Note that only one LAN computer can be a DMZ host at any time.
3. Click 'OK' to save your changes and return to the screen 'DMZ Host'.

You can disable the DMZ host so that it will not be fully exposed to the Internet, but keep its IP address recorded on the 'DMZ Host' screen. This may be useful if you wish to disable the DMZ host but expect that you will want to enable it again in the future.

- To disable the DMZ host so that it will not be fully exposed to the Internet, clear the check-box next to the DMZ IP designation and click 'OK'.
- To re-enable the DMZ host later, recheck the check-box.

## 12.5 Port Triggering

Port triggering can be used for dynamic port forwarding configuration. By setting port triggering rules, you can allow inbound traffic to arrive at a specific LAN host, using ports different than those used for the outbound traffic. This is called port triggering since the outbound traffic triggers to which ports inbound traffic is directed.

For example, consider a gaming server that is accessed using UDP protocol on port 2222. The gaming server responds by connecting the user using UDP on port 3333 when starting gaming sessions. In such a case you must use port triggering, since this scenario conflicts with the following default firewall settings:

- The firewall blocks inbound traffic by default.
- The server replies to the gateway's IP, and the connection is not sent back to your host, since it is not part of a session.

To solve this, you need to define a Port Triggering entry, which allows inbound traffic on UDP port 3333, only after a LAN host generated traffic to UDP port 2222. This results in accepting the inbound traffic from the gaming server and sending it back to the LAN Host which originated the outgoing traffic to UDP port 2222.

Select the tab 'Port Triggering' in the 'Security' screen; the screen 'Port Triggering' opens (refer to the figure). The screen lists all port triggering entries.

8. Click 'OK' to save the settings; the screen 'Edit Service' presents your entered information. Click 'OK' again to save the port triggering rule; the screen 'Port Triggering' now includes the new port triggering entry (refer to the figure).

**Figure 12-19: New Port Triggering Rule**

| Protocol                                                                  | Outgoing Trigger Ports | Incoming Ports to Open        | Action                                                                              |
|---------------------------------------------------------------------------|------------------------|-------------------------------|-------------------------------------------------------------------------------------|
| <input checked="" type="checkbox"/> L2TP - Layer Two Tunneling Protocol   | UDP Any -> 1701        | UDP Any -> Same as Initiating |  |
| <input checked="" type="checkbox"/> TFTP - Trivial File Transfer Protocol | UDP 1024-65535 -> 69   | UDP Any -> Same as Initiating |  |
| <input checked="" type="checkbox"/> game_server                           | UDP Any -> 2222        | UDP Any -> 3333               |  |
| Specify Protocol <b>Add</b>                                               |                        |                               |                                                                                     |

You can disable a port triggering rule without having to remove it from the screen 'Port Triggering'.

- To temporarily disable a rule, clear the check box next to the service name.
- To reinstate it later, simply reselect the check box.
- To remove a rule, click the action icon 'Remove' for the service; the service is permanently removed.

There may be a few default port triggering rules listed when you first access the port triggering screen. Note that disabling these rules may result in impaired gateway functionality.

## 12.6 Website Restrictions

You can configure the gateway to block specific Internet websites so that they cannot be accessed from computers in the home network. Moreover, restrictions can be applied to a comprehensive and automatically-updated table of sites to which access is not recommended.

➤ **To block access to a website:**

1. Click the tab 'Website Restrictions' in the screen 'Security' (refer to the figure).

**Figure 12-20: Website Restrictions**

 **Security**

General Access Control Port Forwarding DMZ Host Port Triggering Remote Administration **Website Restrictions** Advanced Filtering Security Log

Restrict access from the LAN to websites.

| Local Host | Local Address | Restricted Website | Restricted IP Address | Status | Action                                                                              |
|------------|---------------|--------------------|-----------------------|--------|-------------------------------------------------------------------------------------|
| New Entry  |               |                    |                       |        |  |

Press the **Refresh** button to update the data.

2. Click the link 'New Entry'; the 'Restricted Website' screen opens (refer to the figure).

**Figure 12-21: Restricted Website**

 **Restricted Website**

Enter the website you wish to restrict:

|                     |                                         |
|---------------------|-----------------------------------------|
| Restricted Website: | <input type="text"/>                    |
| <b>Local Host</b>   | Any <input type="button" value="v"/>    |
| <b>Schedule</b>     | Always <input type="button" value="v"/> |

3. Enter the website address (IP address or URL) that you would like to make inaccessible from your home network (all Web pages within the site will also be blocked). If the website address has multiple IP addresses, the gateway will resolve all additional addresses and automatically add them to the restrictions table.

The Local Host combo box provides you the ability to specify the computer or group of computers for which you would like to apply the website restriction. You can select between any or a specific computer address in your LAN. If you choose the option 'Specify Address', the screen will refresh and a link 'Add' appears:

**Figure 12-22: Add a Specific Host**

|                   |                   |            |
|-------------------|-------------------|------------|
| <b>Local Host</b> | Specify Address ▼ | <b>Add</b> |
|-------------------|-------------------|------------|

4. Click the link 'Add' to specify a computer address. Specify an address creating a 'Network Object'.

The parameter Schedule allows you to define the time period during which this rule will take effect. You can select between 'Always' or a specific schedule. If you choose the option 'Specify Schedule', the screen will refresh and an 'Add' link will appear:

**Figure 12-23: Add a Specific Schedule**

|                 |                    |            |
|-----------------|--------------------|------------|
| <b>Schedule</b> | Specify Schedule ▼ | <b>Add</b> |
|-----------------|--------------------|------------|

5. Click the link 'Add' to specify a protocol. Click 'OK' to save the settings; you're returned to the previous screen while the gateway attempts to find the site. 'Resolving...' will appear in the Status column while the site is being located (the URL is 'resolved' into one or more IP addresses).
6. Click the 'Refresh' button to update the status if necessary. If the site is successfully located, 'Resolved' will appear in the status bar; if not, 'Hostname Resolution Failed' will appear.

➤ **If the gateway fails to locate the website:**

1. Use a Web browser to verify that the website is available. If it is, then you probably entered the website address incorrectly.
2. If the website is unavailable, return to the screen 'Website Restrictions' later and click the button 'Resolve Now' to verify that the website can be found and blocked by the gateway.
3. You can edit the website restriction by modifying its entry under the column 'Local Host' in the screen 'Website Restrictions'.

➤ **To modify an entry:**

1. Click the action icon 'Edit' for the restriction; the screen 'Restricted Website' opens (refer to the figure). Modify the website address, group or schedule as required.
2. Click 'OK' to save your changes and return to the screen 'Website Restrictions'.

➤ **To ensure that all current IP addresses corresponding to the restricted websites are blocked:**

1. Click button 'Resolve Now'; the gateway checks each of the restricted website addresses and ensures that all IP addresses at which this website can be found are included in the IP addresses column.

You can disable a restriction to make a website available again without having to remove it from the screen 'Website Restrictions'. This can be useful when making the website temporarily available and when expecting to block it again in the future.

- To temporarily disable a rule, clear the check box adjacent to the service name.
- To reinstate it at a later time, recheck the check box.
- To remove a rule, click the action icon 'Remove' for the service; the service will be permanently removed.

## 12.7 Advanced Filtering

Advanced filtering is designed to allow comprehensive control over the firewall's behavior. You can define specific input and output rules, control the order of logically similar sets of rules and make a distinction between rules that apply to WAN and LAN devices.

To view the gateway's advanced filtering options, click the tab 'Advanced Filtering' in the 'Security' screen; the screen 'Advanced Filtering' opens (refer to the figure).

**Input Rule Sets**

| Rule ID                                        | Source Address | Destination Address | Protocols | Operation | Status | Action                    |
|------------------------------------------------|----------------|---------------------|-----------|-----------|--------|---------------------------|
| <b>Initial Rules</b>                           |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>LAN Bridge Rules</b>                        |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>LAN Ethernet Rules</b>                      |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>LAN Wireless 802.11g Access Point Rules</b> |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>LAN USB Rules</b>                           |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>Final Rules</b>                             |                |                     |           |           |        | <a href="#">New Entry</a> |

**Output Rule Sets**

| Rule ID                                        | Source Address | Destination Address | Protocols | Operation | Status | Action                    |
|------------------------------------------------|----------------|---------------------|-----------|-----------|--------|---------------------------|
| <b>Initial Rules</b>                           |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>LAN Bridge Rules</b>                        |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>LAN Ethernet Rules</b>                      |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>LAN Wireless 802.11g Access Point Rules</b> |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>LAN USB Rules</b>                           |                |                     |           |           |        | <a href="#">New Entry</a> |
| <b>Final Rules</b>                             |                |                     |           |           |        | <a href="#">New Entry</a> |

This screen is divided into two identical sections, one for 'Input Rule Sets' and the other for 'Output Rule Sets', which are for configuring inbound and outbound traffic, respectively. Each section is comprised of subsets, which can be grouped into three main subjects:

1. Initial rules - rules defined here will be applied first, on all gateway devices.
2. Network devices rules - rules can be defined per each gateway device.
3. Final rules - rules defined here will be applied last, on all gateway devices.

**Note:** The order of the firewall rules' appearance in the screen 'Advanced Filtering' represents the sequence by which they will be applied.

Numerous rules are automatically inserted by the firewall to provide improved security and block harmful attacks.

➤ **To configure an advanced filtering rule:**

1. After choosing the traffic direction and the device on which to set the rule, click the appropriate link 'New Entry'; the screen 'Add Advanced Filter' opens (refer to the figure).

**Figure 12-25: Add Advanced Filter**

 **Add Advanced Filter**

|                                                                                                                                                   |                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| <b>Matching</b>                                                                                                                                   |                                                                                            |
| <b>Source Address</b>                                                                                                                             | Any       |
| <b>Destination Address</b>                                                                                                                        | Any       |
| <b>Protocol</b>                                                                                                                                   | Any       |
| <b>Operation</b>                                                                                                                                  |                                                                                            |
| <input checked="" type="radio"/> Drop                                                                                                             |         |
| <input type="radio"/> Reject                                                                                                                      |        |
| Drop packets, and send TCP Reset or ICMP Host Unreachable packets to sender.                                                                      |                                                                                            |
| <input type="radio"/> Accept                                                                                                                      |       |
| Accept all packets related to this session. This session is handled by Stateful Packet Inspection (SPI).                                          |                                                                                            |
| <input type="radio"/> Accept Packet                                                                                                               |       |
| Accept packets matching this rule only. Do not use Stateful Packet Inspection (SPI) to also automatically accept packets related to this session. |                                                                                            |
| <input type="radio"/> QoS                                                                                                                         |                                                                                            |
| <b>QoS Operation</b>                                                                                                                              |                                                                                            |
| <input type="checkbox"/> Set Priority                                                                                                             |                                                                                            |
| <input type="checkbox"/> Set DSCP                                                                                                                 |                                                                                            |
| <b>Logging</b>                                                                                                                                    |                                                                                            |
| <input type="checkbox"/> Log Packets Matched by This Rule                                                                                         |                                                                                            |
| <b>Schedule</b>                                                                                                                                   | Always  |

➤ **To apply rules:**

1. Use the screen section 'Matching' to define a match between IP addresses and a traffic protocol.
2. Configure the source address of the packets sent to or received from the network object (computer A in the above example). To add an address, select the option 'Specify Address' from the drop-down list; the screen refreshes and a link 'Add' appears (refer to the figure).

**Figure 12-26: Specify Source Address**

|                       |                                                                                                                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Source Address</b> | <div style="display: flex; align-items: center;"> <div style="border: 1px solid #ccc; padding: 2px 5px; margin-right: 5px;">Specify Address</div> <div style="font-size: 0.8em;">▼</div> <div style="margin-left: 10px; color: #007bff; text-decoration: none;">Add</div> </div> |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

3. Click the link 'Add'; this commences a sequence that adds a new network object.
4. Configure the destination address of the packets sent to or received from the network object. This address can be configured in the same manner as the source address.
5. Choose a specific traffic protocol from the 'Protocol' drop-down list or add a new one. To add a new traffic protocol, choose the 'Specify Protocol' option in the drop-down list; the screen refreshes and a link 'Add' appears (refer to the figure).

**Figure 12-27: Specify Protocol**

|                 |                                                                                                                                                                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Protocol</b> | <div style="display: flex; align-items: center;"> <div style="border: 1px solid #ccc; padding: 2px 5px; margin-right: 5px;">Specify Protocol</div> <div style="font-size: 0.8em;">▼</div> <div style="margin-left: 10px; color: #007bff; text-decoration: none;">Add</div> </div> |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

6. Click the link 'Add'; this commences a sequence that adds a new protocol.
7. In the screen section 'Operation', define what action the rule will take; check one of the following radio buttons:
  - Drop - Deny access to packets that match the source and destination IP addresses and service ports defined in 'Matching'.
  - Reject - Deny access to packets that match the source and destination IP addresses and service ports defined in 'Matching' and sends and sends an ICMP error or a TCP reset to the origination peer.
  - Accept - Allow access to packets that match the source and destination IP addresses and service ports defined in 'Matching'. The data transfer session will be handled using Stateful Packet Inspection (SPI).
  - Accept Packet - Allow access to packets that match the source and destination IP addresses and service ports defined in 'Matching'. The data transfer session will not be handled using Stateful Packet Inspection (SPI), meaning that other packets that match this rule will not be automatically allowed access. For example, this can useful when creating rules that allow broadcasting.
  - QoS - Select this check-box to define QoS Operation for the rule (the following section).

8. Under the screen section 'QoS Operation', set rule priority with Quality of Service by checking the check box (to add a priority to the rule); the screen refreshes (refer to the figure), allowing you to select between one of eight priority levels, zero being the lowest and seven the highest (each priority level is mapped to low/medium/high priority). This sets the priority of a packet on the connection matching the rule, while routing the packet.

**Figure 12-28: Set Priority Rule**

The figure shows a configuration bar with a light blue background. On the left, there is a checked checkbox followed by the text 'Set Priority'. On the right, there is a dropdown menu displaying '0 - Low' with a small downward arrow icon.

9. Check the check box 'Set DSCP' to mark a DSCP value on packets matching this rule; the screen refreshes (refer to the figure), allowing you to enter the hexadecimal value of the DSCP.

**Figure 12-29: Set DSCP Rule**

The figure shows a configuration bar with a light blue background. On the left, there is a checked checkbox followed by the text 'Set DSCP'. On the right, there is a text input field containing the value '0', followed by the text '(Hex)'.

10. Under the screen section 'Logging', check the parameter 'Log Packets Matched by This Rule' to log the first packet from a connection that was matched by this rule.
11. By default, the 'Schedule' rule will always be active. However, you can configure scheduler rules in order to define time segments during which the rule may be active.
12. Click 'OK' to save the settings.

## 12.8 Security Log

The Security log displays a list of firewall-related events, including attempts to establish inbound and outbound connections, attempts to authenticate at an administrative interface (Web-based management or Telnet terminal), firewall configuration and system start-up.

➤ **To view the Security Log:**

1. Click tab 'Security Log' in the screen 'Security Settings'; the screen 'Security Log' opens.

**Figure 12-30: Security Log**

| Time                 | Event          | Event-Type                  | Details                                                               |

| Jun 14 14:24:41 2004 | Firewall Setup | Firewall internal           | Firewall configuration succeeded                                      |
| Jun 14 14:24:41 2004 | Firewall Setup | Firewall internal           | Starting firewall configuration                                       |
| Jun 13 13:01:01 2004 | WBM Login      | User authentication success | Username: admin [repeated 6 times, last time on Jun 14 14:23:16 2004] |
| Jun 13 13:00:26 2004 | Firewall Setup | Firewall internal           | Firewall configuration succeeded                                      |
| Jun 13 13:00:26 2004 | Firewall Setup | Firewall internal           | Starting firewall configuration                                       |
| Jun 13 12:59:25 2004 | CLI Login      | User authentication success | Username: admin                                                       |

2. View column 'Time' to determine the time the event occurred.
3. View column 'Event' to determine the type of event. There are five types of events:
  - Inbound Traffic: The event is a result of an incoming packet.
  - Outbound Traffic: The event is a result of outgoing packet.
  - Firewall Setup: Configuration message.
  - WBM Login: Indicates that a user has logged in to WBM.
  - CLI Login: Indicates that a user has logged in to CLI (via Telnet).
4. View column 'Event-Type' for a textual description of the event:
  - Blocked: The packet was blocked. The message is color-coded red.
  - Accepted: The packet was accepted. The message is color-coded green.
5. View column 'Details' for details of the packet or the event, such as protocol, IP addresses, ports, etc.

➤ **To view or change the security log settings:**

1. Click 'Settings' in the 'Firewall Log' screen; the screen 'Security Log Settings' opens (refer to the figure).

**Figure 12-31: Security Log Settings**

**Security Log Settings**

**Accepted Events**

☐ Accepted Incoming Connections

☐ Accepted Outgoing Connections

**Blocked Events**

|                                                          |                                                 |                                         |

| <input type="checkbox"/> Echo Chargin                    |                                                 |                                         |

**Other Events**

☐ Remote Administration Attempts

☐ Connection States

**Log Buffer**

☐ Prevent Log Overrun

2. Select the types of activities for which you would like to have a log message generated.

**Accepted Events**

- Accepted Incoming Connections - Write a log message for each successful attempt to establish an inbound connection to the home network.
- Accepted Outgoing Connections - Write a log message for each successful attempt to establish an outgoing connection to the public network.

### Blocked Events

- All Blocked Connection Attempts - Write a log message for each blocked attempt to establish an inbound connection to the home network or vice versa. You can enable logging of blocked packets of specific types by disabling this option, and enabling some of the more specific options below it.
- Specific Events - Specify the blocked events that should be monitored. Use this to monitor specific event such as SynFlood. A log message will be generated if either the corresponding check-box is checked, or the check-box 'All Blocked Connection Attempts' is checked.

### Other Events

- Remote Administration Attempts - Write a log message for each remote-administration connection attempt, whether successful or not.
- Connection States - Provide extra information about every change in a connection opened by the firewall. Use this option to track connection handling by the firewall and Application Level Gateways (ALGs).

### Log Buffer

- Prevent Log Overrun - Select this check box in order to stop logging firewall activities when the memory allocated for the log fills up.

### 3. Click 'OK' to save the settings.

Following are the available event types that can be recorded in the firewall log:

Firewall internal - an accompanying explanation from the firewall internal mechanism will be added in case this event-type is recorded.

Firewall status changed - the firewall changed status from up to down or the other way around, as specified in the event type description.

STP packet - an STP packet has been accepted/rejected.

Illegal packet options - the options field in the packet's header is either illegal or forbidden.

Fragmented packet - a fragment has been rejected.

WinNuke protection - a WinNuke attack has been blocked.

ICMP replay - an ICMP replay message has been blocked.

ICMP redirect protection - an ICMP redirected message has been blocked.

Packet invalid in connection - a packet has been blocked, being on an invalid connection.

ICMP protection - a broadcast ICMP message has been blocked.

Broadcast/Multicast protection - a packet with a broadcast/multicast source IP has been blocked.

Spoofing protection - a packet from the WAN with a source IP of the LAN has been blocked.

DMZ network packet - a packet from a demilitarized zone network has been blocked.

Trusted device - a packet from a trusted device has been accepted.

Default policy - a packet has been accepted/blocked according to the default policy.

Remote administration - a packet designated for OpenRG management has been accepted/blocked.

Access control - a packet has been accepted/blocked according to an access control rule.

Parental control - a packet has been blocked according to a parental control rule.

NAT out failed - NAT failed for this packet.

DHCP request - OpenRG sent a DHCP request (depends on the distribution).

DHCP response - OpenRG received a DHCP response (depends on the distribution).

DHCP relay agent - a DHCP relay packet has been received (depends on the distribution).

IGMP packet - an IGMP packet has been accepted.

Multicast IGMP connection - a multicast packet has been accepted.

RIP packet - a RIP packet has been accepted.

PPTP connection - a packet inquiring whether OpenRG is ready to receive a PPTP connection has been accepted.

Kerberos key management 1293 - security related, for future use.

Kerberos 88 - for future use.

AUTH:113 request - an outbound packet for AUTH protocol has been accepted (for maximum security level).

Packet-Cable - for future use.

IPV6 over IPV4 - an IPv6 over IPv4 packet has been accepted.

ARP - an ARP packet has been accepted.

PPP Discover - a PPP discover packet has been accepted.

PPP Session - a PPP session packet has been accepted.

802.1Q - a 802.1Q (VLAN) packet has been accepted.

Outbound Auth1X - an outbound Auth1X packet has been accepted.

IP Version 6 - an IPv6 packet has been accepted.

OpenRG initiated traffic - all traffic that OpenRG initiates is recorded.

Maximum security enabled service - a packet has been accepted because it belongs to a permitted service in the maximum security level.

SynCookies Protection - a SynCookies packet has been blocked.

ICMP Flood Protection - a packet has been blocked, stopping an ICMP flood.

UDP Flood Protection - a packet has been blocked, stopping a UDP flood.

Service - a packet has been accepted because of a certain service, as specified in the event type.

Advanced Filter Rule - a packet has been accepted/blocked because of an advanced filter rule.

Fragmented packet, header too small - a packet has been blocked because after the defragmentation, the header was too small.

Fragmented packet, header too big - a packet has been blocked because after the defragmentation, the header was too big.

Fragmented packet, drop all - not used.

Fragmented packet, bad align - a packet has been blocked because after the defragmentation, the packet was badly aligned.

Fragmented packet, packet too big - a packet has been blocked because after the defragmentation, the packet was too big.

Fragmented packet, packet exceeds - a packet has been blocked because defragmentation found more fragments than allowed.

Fragmented packet, no memory - a fragmented packet has been blocked because there was no memory for fragments.

Fragmented packet, overlapped - a packet has been blocked because after the defragmentation, there were overlapping fragments.

Defragmentation failed - the fragment has been stored in memory and blocked until all fragments arrived and defragmentation could be performed.

Connection opened - usually a debug message regarding a connection.

Wildcard connection opened - usually a debug message regarding a connection.

Wildcard connection hooked - usually debug message regarding connection.

Connection closed - usually a debug message regarding a connection.

Echo/Chargen/Quote/Snork protection - a packet has been blocked, protecting from Echo/Chargen/Quote/Snork.

First packet in connection is not a SYN packet - a packet has been blocked because of a TCP connection that had started without a SYN packet.

Error: No memory - a message notifying that a new connection has not been established because of lack of memory.

NAT Error : Connection pool is full - a message notifying that a connection has not been created because the connection pool is full.

NAT Error: No free NAT IP - a message notifying that there is no free NAT IP, therefore NAT has failed.

NAT Error: Conflict Mapping already exists - a message notifying that there is a conflict since the NAT mapping already exists, therefore NAT has failed.

Malformed packet: Failed parsing - a packet has been blocked because it is malformed.

Passive attack on ftp-server: Client attempted to open Server ports - a packet has been blocked because of an unauthorized attempt to open a server port.

FTP port request to 3rd party is forbidden (Possible bounce attack) - a packet has been blocked because of an unauthorized FTP port request.

Firewall Rules were changed - the firewall rule set has been modified.

User authentication - a message during login time, including both successful and failed authentication.

First packet is Invalid - First packet in connection failed to pass firewall or NAT

## 13 Advanced Settings

This section of the Web-based Management is intended primarily for more advanced users. Some changes to settings within this section could adversely affect the operation of the MP-202 and the home network, and should be made with caution.

From the Advanced screen you can (refer to the table below):

**Table 13-1: Action Icons in the Advanced Screen**

| Icon                                                                                                       | What you can do                                                        |
|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| <br>Remote Administration | Configure remote administration privileges                             |
| <br>About the MP-202      | View technical information about the gateway, including version number |
| <br>Configuration File   | Load the Configuration File to the MP-202                              |
| <br>Restart             | Restart the MP-202                                                     |
| <br>Restore Defaults    | Restore default factory settings                                       |
| <br>Diagnostics         | Perform networking diagnostics                                         |
| <br>MAC Cloning         | Clone MP-202's MAC address.                                            |
| <br>Regional Settings   | Change the regional settings                                           |
| <br>System Settings     | Modify administrator settings, including the MP-202's hostname         |
| <br>SNMP                | Configure the MP-202's SNMP agent                                      |

| Icon                                                                                                           | What you can do                                                                                                 |
|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <br>Universal Plug and Play   | Configure Universal Plug and Play (UPnP) parameters                                                             |
| <br>MP-202 Firmware Upgrade   | Perform a Firmware Upgrade                                                                                      |
| <br>Scheduler Rules           | Define time segments for system rules                                                                           |
| <br>Date and Time             | Set the local date and time                                                                                     |
| <br>Users                     | Configure users                                                                                                 |
| <br>Routing                 | Manage routing policies                                                                                         |
| <br>Network Objects         | Define groups of LAN devices for system rules                                                                   |
| <br>Dynamic DNS             | View and modify the DNS Hosts table                                                                             |
| <br>IP Address Distribution | Modify the behavior of the DHCP server for each LAN device and view a list of DHCP clients in the local network |
| <br>DNS Server              | Alias a dynamic IP address to a static hostname                                                                 |
| <br>Protocols               | Manage protocols                                                                                                |

**Figure 13-1: Advanced Settings**

## 13.1 Remote Administration

It is possible to access and control the MP-202 not only from within the home network, but also from the Internet. This allows you to view or change settings while travelling. It also enables you to allow your ISP to change settings or help you trouble-shoot functionality or communication issues from a remote location.

Remote access to the MP-202 is blocked by default to ensure the security of your home network. However, remote access is supported by the following services, and you may use the 'Remote Access Configuration' screen to selectively enable these services if they are needed.

### ➤ To view the device's remote administration options:

- Click the icon 'Remote Administration' in the 'Advanced' screen of the Web-based management; the 'Remote Administration' screen appears.

**Figure 13-2: Remote Administration**

|                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------|
| <b>Allow Incoming Access to the Telnet Server</b>                                                                    |
| <input type="checkbox"/> Using Primary Telnet Port (23)                                                              |
| <input type="checkbox"/> Using Secondary Telnet Port (8023)                                                          |
| <input type="checkbox"/> Using Secure Telnet over SSL Port (992)                                                     |
| <b>Allow Incoming Access to the Web-Management</b>                                                                   |
| <input type="checkbox"/> Using Primary HTTP Port (80)                                                                |
| <input type="checkbox"/> Using Secondary HTTP Port (8080)                                                            |
| <input type="checkbox"/> Using Primary HTTPS Port (443)                                                              |
| <input type="checkbox"/> Using Secondary HTTPS Port (8443)                                                           |
| <b>Allow SNMP Control and Diagnostic Requests</b>                                                                    |
| <input type="checkbox"/> Allow Incoming SNMP Requests                                                                |
| <b>Diagnostic Tools</b>                                                                                              |
| <input type="checkbox"/> Allow Incoming ICMP Echo Requests (e.g. pings and ICMP traceroute queries)                  |
| <input type="checkbox"/> Allow Incoming UDP Traceroute Queries                                                       |
| <b>JCMS Outgoing</b>                                                                                                 |
| <input checked="" type="checkbox"/> Allow the Remote Upgrade Server () to Control MP202                              |
|  Configure MP202 Firmware Upgrade |
| <b>JCMS Incoming</b>                                                                                                 |
| <input type="checkbox"/> Listen to JCMS Incoming Requests on Port <input type="text" value="7020"/>                  |
| <input type="checkbox"/> Accept JCMS Incoming Packets                                                                |
| <input type="checkbox"/> Listen to JCMS SSL Incoming Requests on Port <input type="text" value="7021"/>              |
| <input type="checkbox"/> Accept JCMS SSL Incoming Packets                                                            |

**Note:** Telnet and Web-Management can be used to modify the settings of the firewall or to disable it. Users can also change local IP addresses and other settings, making it difficult or impossible to access the Telephone Adapter from the home network. Therefore, remote access to Telnet or HTTP services should be blocked and should only be permitted when absolutely necessary.

➤ **To allow remote access to MP-202 services:**

1. Click the 'Remote Administration' button. The 'Remote Access Configuration' screen will appear (refer to the figure above).
2. Select the services that you would like to make available to computers on the Internet.

3. Click 'OK' to save your changes and return to the 'Security Settings' screen.

Encrypted remote administration is done using a secure SSL connection, that requires an SSL certificate. When accessing the MP-202 for the first time using encrypted remote administration, you will be prompted by your browser with a warning regarding certificate authentication. This is due to the fact that the MP-202's SSL certificate is self generated. When encountering this message under these circumstances, ignore it and continue. It should be noted that even though this message appears, the self generated certificate is safe, and provides you with a secure SSL connection.

It is also possible to assign a user-defined certificate to the MP-202.

## 13.2 About the MP-202

- **To view technical information regarding the MP-202:**

1. Click the icon 'About the MP-202' in the 'Advanced' screen of the Web-based Management; the screen 'About the MP-202' appears showing the version, the release date and the supported features (refer to the figure).

**Figure 13-3: Advanced - About the Gateway**

## 13.3 Configuration File

Your gateway enables you to view, save and load its configuration file in order to backup and restore your current configuration.

1. Click the icon 'Configuration File' in the 'Advanced' screen of the Web-based management; the 'Configuration File' screen is displayed (refer to the figure) showing the entire contents of the configuration file.

**Figure 13-4: Contents of the Configuration File**

2. Click the button 'Load Configuration File' to restore your configuration from a file and restart the gateway.
3. Click 'Save Configuration File' to back up your current configuration to a file.

**Note:** When rebooting, the gateway restores the settings from its configuration file. However, if reboot attempts fail three times consecutively, the gateway resets the configuration file by restoring factory defaults before attempting to reboot.

## 13.4 Restart

➤ **To restart your gateway:**

1. Click the icon 'Restart' in the 'Advanced' screen of the Web-based Management; the 'Restart' screen is displayed (refer to the figure below).

**Figure 13-5: Advanced - Restart**

2. Press 'OK' to restart the gateway. This may take up to one minute.
3. To re-enter the Web-based Management after restarting the gateway, click the browser's 'Refresh' button.

## 13.5 Restoring Default Settings

You can restore the MP-202's factory default settings when, for example, you're building a new network from the beginning or when you cannot recall changes made to the network and you need to go back to the default configuration).

➤ **To restore default settings:**

1. Click the 'Restore Defaults' icon in the 'Advanced' screen of the Web-based Management; the 'Restore Defaults' screen is displayed (refer to the figure).

**Figure 13-6: Restore Defaults**

2. Click 'OK' to restore the MP-202's factory default settings.

**Note:** If you are accessing the MP-202's Web from the WAN, restoring the factory settings will cause the connection to be lost, since access to the Web from the WAN is blocked by default.

In cases where the Web server cannot be accessed (for example if you've forgotten the password or if the LAN is disabled), it's possible to restore the default settings using a manual procedure.

➤ **To restore default settings manually:**

1. Disconnect the MP-202 DC power cable.
2. Using a paper clip, press the pushbutton located on the bottom of the MP-202 (a pinhole at one of the corners)
3. While pressing the pushbutton, power up the device. Keep the pushbutton pressed for another 5 seconds.

**Note:** All Web-based management settings and parameters, not only those in the Advanced section, will be restored to their default values. This includes the administrator password; a user-specified password will no longer be valid.

## 13.6 Diagnostics

The Diagnostics screen can assist you to test network connectivity and view statistics, such as the number of packets transmitted and received, round-trip time and success status. The test tools are platform-dependent and are not available simultaneously.

## 13.6.1 Diagnosing Network Connectivity

➤ **To diagnose network connectivity:**

1. Click the 'Diagnostics' icon from the 'Advanced' screen in the Web-based Management; the 'Diagnostics' screen is displayed.

**Figure 13-7: Advanced - Diagnostics**

**Diagnostics**

**Ping (ICMP Echo)**

Destination:

Number of pings:

Status:

**Traceroute**

Destination:

Status:

Press the **Refresh** button to update the status.

2. Under the screen section 'Ping (ICMP Echo)', enter the IP address or URL to be tested in the 'Destination' field.
3. Enter the number of pings you would like to perform.
4. Press the 'Go' button.

5. In a few seconds, diagnostic statistics are displayed (refer to the figure below). If no new information is displayed, press the 'Refresh' button.

**Figure 13-8: Advanced - Diagnostics - Statistics**

**Diagnostics**

| Ping (ICMP Echo) |                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destination:     | <input type="text" value="10.33.2.40"/> <span style="float: right; border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; background-color: #f0f0f0;">Go</span> |
| Number of pings: | <input type="text" value="4"/>                                                                                                                                           |
| Status:          | Test Succeeded                                                                                                                                                           |
| Packets:         | 4/4 transmitted, 4/4 received, 0% loss                                                                                                                                   |
| Round Trip Time: | Minimum = 30 ms<br>Maximum = 35 ms<br>Average = 31 ms                                                                                                                    |

| Traceroute                                                                                                                                                |                                                                                                                                                                          |

Refresh

## 13.6.2 Performing a Traceroute

### ➤ To perform a traceroute:

1. Click the 'Diagnostics' icon from the 'Advanced' screen in the Web-based Management; the 'Diagnostics' screen is displayed.
2. Under the screen section 'Traceroute', enter the IP address or URL to be tested in the 'Destination' field.
3. Press the button 'Go'; a traceroute commences, constantly refreshing the screen (refer to the figure above).
4. To stop the trace and view the results, press 'Cancel'.

## 13.7 MAC Cloning

A Media Access Control (MAC) address is the numeric code that identifies a device on a network, such as your external cable/DSL modem or a PC network card. Your Service Provider may ask you to supply the MAC address of your PC, external modem, or both. When replacing an external modem with your gateway, you can simplify the installation process by copying the MAC address of your existing PC to the gateway.

In such a case, you do not need to delay the setup process by informing your Service Provider of newly installed equipment.

➤ **To use MAC cloning:**

1. Click the 'MAC Cloning' icon in the 'Advanced' screen of the Web-based Management; the MAC Cloning screen appears (refer to the figure).

**Figure 13-9: Advanced - MAC Cloning Settings**

2. Enter the physical MAC address to be cloned.
3. Press the button 'Clone My MAC Address'.

## 13.8 Regional Settings

The behavior and parameters of analog telephones lines vary between countries. The set of Call Progress Tones, the protocol used for caller ID and the analog line impedance are all location-specific. The MP-202 enables users to select the country they reside in and the MP-202 automatically selects the correct regional settings.

➤ **To select your present location:**

1. Click the icon 'Regional Settings' in the 'Advanced' screen of the Web-based Management; the 'Regional Settings' screen opens (refer to the figure below).
2. Select the country from the drop-down menu. If your current location is not in the list, contact your Service Provider.

**Figure 13-10: Regional Settings**

## 13.9 System Settings

The screen 'System Settings' allows you to configure various system and management parameters.

**Use the screen section 'System Settings' to configure:**

- The Telephone Adapter's host name. The host name is the Telephone Adapter's URL address.
- Your network's local domain.

**Use the screen section 'MP-202 Management Console' to configure:**

- Automatic Refresh of System Monitoring Web Pages - select this check-box to enable the automatic refresh of system monitoring web pages.
- Warn User Before Network Conguration Changes - select this check-box to activate user warnings before network configuration changes take effect.
- Session Lifetime - the duration of idle time (in seconds) in which the WBM session will remain active. When this duration times out, the user will have to re-login.
- Language - select a different language for the WBM interface.

Use the link 'Remote Administration' to access the MP-202's remote administration screen, from where you can selectively enable services that grant remote access to the MP-202.

**Use the screen section 'Management Application Ports' to configure:**

- Primary/secondary HTTP ports
- Primary/secondary HTTPS ports
- Primary/secondary Telnet ports
- Secure Telnet over SSL ports

**Use the screen section 'System Logging' to configure:**

- System Log buffer size
- Remote system notify level
  - None
  - Error
  - Warning
  - Information

**Use the screen section 'Security Logging' to configure:**

- Security Log buffer size
- Remote system notify level
  - None
  - Error
  - Warning
  - Information

**Use the screen section 'Outgoing Mail Server':**

- Enter the hostname of your outgoing (SMTP) server in the 'Server' field.
- Each email requires a 'from' address and some outgoing servers refuse to forward mail without a valid 'from' address for anti-spam considerations. Enter a 'from' email address in the 'From Email Address' field.
- If your outgoing mail server requires authentication check the 'Server Requires Authentication' check-box and enter your user name and password in the 'User Name' and 'Password' fields respectively.

- Enter the port that is used by your outgoing mail server.

## 13.10 SNMP

Simple Network Management Protocol (SNMP) enables Network Management Systems (NMSs) to remotely configure and monitor your gateway. Your Internet Service Provider (ISP) may use SNMP to identify and resolve technical problems.

### 13.10.1 Configuring Your Gateway's SNMP Agent

Technical information regarding the properties of the gateway's SNMP agent should be provided by your ISP.

➤ **To configure the gateway's SNMP agent:**

1. Click the icon 'Simple Network Management Protocol (SNMP)' in the 'Advanced' screen of the Web-based Management; the SNMP screen appears (refer to the figure).

**Figure 13-12: Advanced - SNMP**

**Simple Network Management Protocol (SNMP)**

☒ Enable SNMP Agent

Read-Only Community Name:

Read-Write Community Name:

Trusted Peer:

**SNMP Traps**

☒ Enabled

Version:

Destination:

Community:

2. Define the SNMP parameters according to the instructions of the ISP:

|                                 |                                                                                                                                                                                                                                                                 |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Read-only/Write Community Names | SNMP community strings are passwords used in SNMP messages between the management system and the gateway. A read-only community allows the manager to monitor the gateway. A read-write community allows the manager to both monitor and configure the gateway. |
| SNMP Trusted Peer               | The IP address, or subnet of addresses, that identify which remote management stations are allowed to perform SNMP operations on the gateway.                                                                                                                   |
| SNMP Traps                      | Messages sent by the gateway to a remote management station, in order to notify the manager about the occurrence of important events or serious conditions. The gateway supports both SNMP version 1 and SNMP version 2c traps.                                 |

## 13.11 Universal Plug and Play

### ➤ To configure UPnP:

- Click the icon 'Universal Plug and Play' in the 'Advanced' screen of the Web-based Management; the 'Universal Plug and Play' screen appears (refer to the figure).

**Figure 13-13: Advanced - Universal Plug n Play**

Universal Plug-and-Play is a networking architecture that provides compatibility among networking equipment, software and peripherals. UPnP-enabled products can seamlessly connect and communicate with other Universal Plug-and-Play enabled devices, without the need for user configuration, centralized servers, or product-specific device drivers. This technology leverages existing standards and technologies, including TCP/IP, HTTP 1.1 and XML, facilitating the incorporation of Universal Plug-and-Play capabilities into a wide range of networked products for the home.

Universal Plug-and-Play technologies are rapidly adopted and integrated into widely-used consumer products such as Windows XP. Therefore it is critical that today's Residential Gateways be UPnP-compliant. Your gateway is at the forefront of this development, offering a complete software platform for UPnP devices. This means that any UPnP-enabled control point (client) can dynamically join the network, obtain an IP address and exchange information about its capabilities and those of other computers on the network. They can subsequently communicate with each other directly, thereby further enabling peer-to-peer networking. And this all happens automatically, providing a truly zero-configuration network.

## 13.12 Firmware and Configuration Upgrade

The MP-202 offers a built-in mechanism for upgrading its software image. There are two methods for upgrading the software image:

Upgrading from a Computer on the Network - use a software image file pre-downloaded to your PC's disk drive or located on the accompanying CD.

Upgrading from the Internet - also referred to as 'Remote Update', use this method to upgrade your firmware by remotely downloading an updated software image file.

Go to: 'Upgrading from a Computer on the Network' on page 181

Go to: 'Upgrading from the Internet' on page 182

### 13.12.1 Upgrading From a Computer in the Network

- To upgrade the MP-202's software image using a locally available .rmt file:

**Note:** You can only use files with an *rmt* extension when performing the firmware upgrade procedure.

1. Click the icon 'MP-202 Firmware and Configuration Upgrade' from the 'Advanced' screen; the screen 'MP-202 Firmware and Configuration Upgrade' opens (refer to the figure).

Figure 13-14: MP-202 Firmware and Configuration Upgrade

**Upgrade From the Internet:**

 Automatically Check for New Versions and Upgrade MP202

Check every 24 hours at URL

Next check scheduled in 0:30 hours

Status: No response received from the upgrade server.

Internet Version: No new version available

**Upgrade From a Computer in the Network:**

 Select an updated MP202 firmware file from a computer's hard drive or CD on the network

Press the **Refresh** button to update the status.

2. In the screen section 'Upgrade From a Computer in the Network', click the button 'Upgrade Now'; the screen 'Upgrade From a Computer in the Network' opens (refer to the figure).

**Figure 13-15: Upgrade From a Computer in the Network**

3. Enter the path of the software image file or click 'Browse' and navigate to the *mt* file on your PC. Click 'OK'; the file starts loading from your PC to your gateway. When loading is complete, a confirmation screen prompts you if you want to upgrade to the new version.
4. Click 'OK' to confirm; the upgrade process commences and shouldn't take longer than a couple of minutes to complete.

5. At the conclusion of the upgrade process, the device automatically reboots. The new software version runs, maintaining your custom configurations and settings.

**Note:** Do not power down the MP-202 or stop the upgrade process in the middle or else the MP-202 will become inoperable.

### 13.12.2 Upgrading From the Internet

The Remote Update mechanism helps you keep your software image up-to-date, by performing routine daily checks for newer software versions, as well as letting you perform manual checks.

To view the automatic check utility's settings and last check result, click the 'MP-202 Firmware Upgrade' icon from the 'Advanced' screen. The 'MP-202 Firmware Upgrade' screen will appear.

In the 'Upgrade From the Internet' section, you can select the utility's checking method and interval. The result of the last performed check is displayed by the line between the 'Check Now' and 'Force Upgrade' buttons, indicating whether a new version is available or not.

■ If a new version is available:

1. Press the 'Force Upgrade' button. A download process will begin. When downloading is completed, a confirmation screen will appear, asking you if you want to upgrade to the new version.
2. Click 'OK' to confirm. The upgrade process will begin and should take no longer than one minute to complete.

At the conclusion of the upgrade process, the MP-202 will automatically reboot. The new software version will run.

■ If a new version is not available:

1. Press the 'Check Now' button to perform an immediate check (instead of waiting for the next scheduled one). The screen will display a green "Check in progress..." message.

**Figure 13-16: Remote Update Check**

**Upgrade From the Internet:**

 Automatically Check for New Versions and Upgrade

Check every 24 hours at URL <https://www.audiocodes.com/oper>

Next check scheduled in 2:49 hours

Check Now

Internet Version: No new version available

Force Upgrade

2. Press the 'Refresh' button until the check is completed and the result is displayed.

### 13.12.3 Remote Configuration Download

The MP-202 can download a configuration file from the Internet. The downloaded file can be triggered manually from the Command Line Interface, or automatically every time the device is powered up.

#### ➤ To download a configuration file using the CLI:

1. Using Telnet, access the device and enter the user name and password.
2. Enter the command 'rmt\_config', for example:

```
rmt_config -u http://myserver.com/my_conf_file.conf
```

➤ **To enable automatic configuration download at power up:**

1. Using Telnet, access the device and enter the user name and password.

2. Set the following configuration parameters:

```
rg_conf_set /rmt_config/enabled 1
```

```
rg_conf_set /rmt_config/url <required url>
```

( for example `rg_conf_set /rmt_config/url http://myserver.com/my_conf_file.conf` )

The next time the device is powered up, it will attempt to download the configuration file.

**Notes:**

- The configuration parameter '/rmt\_config/version' defines the version of the configuration file. The device uses the new configuration file only if the version that is defined in this file is larger than the current version. By default, the 'version' is set to 0. This means that each time Service Providers' operations personnel require the device to download a new configuration file, they need to increment the 'version' parameter in the new file (in the .conf file, the 'version' parameter is under the section 'rmt\_config').
- The remote configuration file can include a subset of the complete mp202.conf file. A recommended procedure is to upload a mp202.conf file from a working device system and remove all sections except those that should be modified by the remote configuration. For example, a Service Provider can choose to configure just the section 'voip'. The configuration file must include the root 'rg\_conf' and the section 'rmt\_config'. The structure and integrity of the configuration file must be preserved.
- The string <MAC> enables the ISP to configure all its deployed systems with the same URL and file details (under rmt\_config/url). Once the URL is configured with the string <MAC>, the system which is trying to update its configuration file automatically replaces <MAC> with its own unique MAC address. For example, if there's a system with a WAN MAC address 00:01:02:03:04:05, the ISP should configure the url with command - `_conf_set /rmt_config/url http://myserver.com/my_conf_file_<MAC>.conf` - and place a file called 'my\_conf\_file\_00\_01\_02\_03\_04\_05.conf'.

## 13.13 Scheduler Rules

Scheduler rules are used for limiting the activation of Firewall rules to specific time periods, specified in days of the week, and hours.

➤ **To define a Rule:**

1. Click the icon 'Scheduler Rules' in the 'Advanced' screen of the Web-based Management; the 'Scheduler Rules' screen appears (refer to the figure).

**Figure 13-17: Advanced - Scheduler Rules**

- Click the link 'New Scheduler Entry'; the 'Scheduler Rule Edit' screen appears (refer to the figure).

**Figure 13-18: Advanced - Scheduler Rules - Edit Scheduler Rule**

**Edit Scheduler Rule**

Name:

**Rule Activity Settings**

☒ Rule will be active at the scheduled time.

☐ Rule will be inactive at the scheduled time.

| Time Segments          | Action |
|------------------------|--------|
| New Time Segment Entry |        |

- Specify a name for the rule in the 'Name' field.
- Specify if the rule will be active/inactive during the designated time period, by selecting the appropriate 'Rule Activity Settings' check-box.
- Click the link 'New Time Segment Entry' to define the time segment to which the rule will apply; the 'Time Segment Edit' screen appears (refer to the figure).

**Figure 13-19: Advanced - Scheduler Rules - Time Segment Edit**

**Edit Time Segment**

**Days of Week**

☐ Monday

☐ Tuesday

☐ Wednesday

☐ Thursday

☐ Friday

☐ Saturday

☐ Sunday

**Hours Range**

| Start Time            | End Time | Action |
|-----------------------|----------|--------|
| New Hours Range Entry |          |        |

- a. Select active/inactive days of the week.
  - b. Click the 'New Time Segment Entry' to define an active/inactive hourly range.
6. Click 'OK' to save the settings.

## 13.14 Date & Time

### ➤ To configure date, time and daylight savings time settings:

1. Click the 'Date and Time' icon in the 'Advanced' screen of the Web-based Management. The 'Date & Time' settings screen will be displayed.

**Figure 13-20: Date & Time Settings**

**Date and Time**

|                                             |                                                                                                                                                                         |

| Protocol:                                   | <input type="radio"/> Time Of Day (TOD)<br><input checked="" type="radio"/> Network Time Protocol (NTP)                                                                 |
| Update Every:                               | 24 Hours                                                                                                                                                                |
| <b>Time Server</b>                          | <b>Action</b>                                                                                                                                                           |
| ntp.jungo.com                               |   |
| <b>New Entry</b>                            |                                                                                      |
| Status:                                     | Waiting for response from server                                                                                                                                        |

2. Select the local time zone from the pull-down menu. The MP-202 can automatically detect daylight saving setting for selected time zones. If the daylight saving settings for your time zone are not automatically detected, the following fields will be displayed:

|                |                                                       |
|----------------|-------------------------------------------------------|
| <b>Enabled</b> | Select this check box to enable daylight saving time. |
| <b>Start</b>   | Date and time when daylight saving starts.            |
| <b>End</b>     | Date and time when daylight saving ends.              |
| <b>Offset</b>  | Daylight saving time offset.                          |

➤ **For the Telephone Adapter to perform an automatic time update:**

- Select the 'Enabled' checkbox under the 'Automatic Time Update' section.
- Select the protocol to be used to perform the time update by selecting wither the 'Time of Day' or 'Network Time Protocol' radio button.
- Specify how often to perform the update in the 'Update Every' field.
- You can define time server addresses by pressing the 'New Entry' link on the bottom of the 'Automatic Time Update' section.

## 13.15 Configuring Users

You can add, edit and delete users. When adding a user, you need to specify the following parameters:

**Table 13-2: Managing Users**

| Parameter                  | Description                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Full Name</b>           | The remote user's full name.                                                                                             |
| <b>User Name</b>           | The name a remote user will use to access your home network.                                                             |
| <b>New Password</b>        | Type a new password for the remote user. If you do not want to change the remote user's password leave this field empty. |
| <b>Retype New Password</b> | If a new password was assigned, type it again to verify correctness.                                                     |

**Figure 13-21: Managing Users**

**User Settings**

---

**General**

|                             |                                            |
|-----------------------------|--------------------------------------------|
| Full Name:                  | <input type="text" value="Administrator"/> |
| User Name (case sensitive): | <input type="text" value="admin"/>         |
| New Password:               | <input type="password" value="XXXXXXXX"/>  |
| Retype New Password:        | <input type="password" value="XXXXXXXX"/>  |

**E-Mail** Configure Mail Server

|                        |                                   |
|------------------------|-----------------------------------|
| Address:               | <input type="text"/>              |
| System Notify Level:   | <input type="text" value="None"/> |
| Security Notify Level: | <input type="text" value="None"/> |

Note that changing any of the user parameters will prompt the connection associated with the user to terminate. For changes to take effect you should activate the connection manually after modifying user parameters.

### 13.15.1 Email Notification

You can use email notification to receive indications of system events for a predefined severity classification. The available types of events are 'System' or 'Security' events. The available severity of events are 'Error', 'Warning' and 'Information'. If the 'Information' level is selected the user will receive notification of 'Information', 'Warning' and 'Error' events. If the 'Warning' level is selected the user will receive notification of 'Warning' and 'Error' events etc.

➤ **To configure email notification for a specific user:**

1. Make sure you have configured an outgoing mail server in 'System Settings'. A click on the 'Configure Mail Server' link will display the 'System Settings' page where you can configure the outgoing mail server.
2. Enter the user's email address in the 'Address' field in the 'Email' section.
3. Select the 'System' and 'Security' notification levels in the 'System Notify Level' and 'Security Notify Level' combo boxes respectively.

## 13.16 Routing

### 13.16.1 Managing Routing Table Rules

You can access the routing table rules by clicking the 'Routing' icon from the 'Advanced' screen. The 'Routing' screen will appear.

Figure 13-22: Routing Rules

The 'Routing' dialog box features a green icon with two arrows pointing in opposite directions. It contains a 'Routing Table' section with a table of existing rules and a 'New Route' button. Below this is a 'Routing Protocols' section with checkboxes for 'Routing Information Protocol (RIP)' and 'Multicasting'. At the bottom are 'OK' and 'Cancel' buttons.

| Routing Table                                                                                        |             |             |                 |        |         |                                                                                                                                                                         |
|------------------------------------------------------------------------------------------------------|-------------|-------------|-----------------|--------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                                                                 | Destination | Gateway     | Netmask         | Metric | Status  | Action                                                                                                                                                                  |
| LAN Ethernet                                                                                         | 192.168.2.3 | 192.168.1.1 | 255.255.255.255 | 20     | Applied |   |
| <b>New Route</b>  |             |             |                 |        |         |                                                                                                                                                                         |

**Routing Protocols**

☐ Routing Information Protocol (RIP)

☒ Multicasting

When adding a routing rule, you need to specify:

**Table 13-3: Adding a Routing Rule - Parameter Descriptions**

| Parameter          | Description                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Device</b>      | Select the network device.                                                                                                                                                                               |
| <b>Destination</b> | The destination is the destination host, subnet address, network address, or default route. The destination for a default route is 0.0.0.0.                                                              |
| <b>Netmask</b>     | The network mask is used in conjunction with the destination to determine when a route is used.                                                                                                          |
| <b>Gateway</b>     | Enter the Telephone Adapter's IP address.                                                                                                                                                                |
| <b>Metric</b>      | A measurement of the preference of a route. Typically, the lowest metric is the most preferred route. If multiple routes exist to a given destination network, the route with the lowest metric is used. |

**Figure 13-23: Routing Rule Settings**

The figure shows a 'Route Settings' dialog box with a green double-headed arrow icon. It contains the following fields:

- Name:** A dropdown menu showing 'LAN Ethernet'.
- Destination:** Four input boxes containing '192', '.168', '.2', and '.3'.
- Netmask:** Four input boxes containing '255', '.255', '.255', and '.255'.
- Gateway:** Four input boxes containing '192', '.168', '.1', and '.1'.
- Metric:** A single input box containing '20'.

At the bottom are two buttons: 'OK' (with a green checkmark) and 'Cancel' (with a red X).

## 13.16.2 Multicasting

The MP-202 provides support for IGMP multicasting, which allows hosts connected to a network to be updated whenever an important change occurs in the network. A multicast is simply a message that is sent simultaneously to a pre-defined group of recipients. When you join a multicast group you will receive all messages addressed to the group, much like what happens when an e-mail message is sent to a mailing list.

IGMP multicasting enables UPnP capabilities over wireless networks and may also be useful when connected to the Internet through a router. When an application running on a computer in the home network sends out a request to join a multicast group the MP-202 intercepts and processes the request. If the MP-202 is set to 'Minimum Security' no further action is required. However, if the MP-202 is set to 'Typical Security' or 'Maximum Security' you must add the group's IP address to the MP-202's 'Multicast Groups' screen. This will allow incoming messages addressed to the group to pass through the Firewall and on to the correct LAN computer.

1. Click the 'Routing' icon in the 'Advanced' screen.

2. Select the 'Multicast Groups Management' check-box.
3. Press the 'OK' button.

## 13.17 Network Objects

Network Objects is a method used to abstractly define a set of LAN hosts, according to one or more MAC address, IP address, and host name. Defining such a group can assist when configuring system rules. For example, network objects can be used when configuring the gateway's security filtering settings such as IP address filtering, host name filtering or MAC address filtering.

You can use network objects in order to apply security rules based on host names instead of IP addresses. This may be useful, since IP addresses change from time to time. Moreover, it is possible to define network objects according to MAC addresses, making rule application more persistent against network configuration settings.

### ➤ To define a network object:

1. Click the icon 'Network Objects' in the 'Advanced' screen of the Web-based Management; the 'Network Objects' screen appears (refer to the figure).

Network Objects

2. Click the link 'New Entry', the 'Edit Network Object' screen appears (refer to the figure).

Edit Network Object

3. Name the network object in the Description field, and click New Entry to actually create it; the 'Edit Item' screen appears (refer to the figure).
4. The source address can be entered in one of the following methods:
  - IP Address
  - IP Subnet
  - IP Range
  - MAC Address
  - Host Name
5. When selecting a method from the combo box, the screen refreshes, presenting the respective fields by which to enter the relevant information.

Edit Item

6. Select a method and enter the source address accordingly.
7. Click 'OK' to save the settings.

## 13.18 Dynamic DNS

The Dynamic DNS (DDNS) service enables you to alias a dynamic IP address to a static hostname, allowing your computer to be more easily accessible from various locations on the Internet. Typically, when you connect to the Internet, your service provider assigns an unused IP address from a pool of IP addresses, and this address is used only for the duration of a specific connection. Dynamically assigning addresses extends the usable pool of available IP addresses, whilst maintaining a constant domain name.

When using the DDNS service, each time the IP address provided by your ISP changes, the DNS database will change accordingly to reflect the change. In this way, even though your IP address will change often, your domain name will remain constant and accessible.

### 13.18.1 Opening a Dynamic DNS Account

To be able to use the DDNS feature, you must first open a free DDNS account at <http://www.dyndns.org/account/create.html>.

When applying for an account, you will need to specify a user name and password. Have them readily available when customizing the MP-202's DDNS support. For detailed information on DDNS, refer to <http://www.dyndns.org>.

#### ➤ To open a dynamic DNS account:

- Click the icon 'Dynamic DNS' in the 'Advanced' screen of the Management Console; the 'Dynamic DNS' connections screen opens (refer to the figure) displaying a table showing the different connections and their DDNS aliases.

**Figure 13-24: Advanced - Dynamic DNS**

 **Dynamic DNS**

| Connections    | Connection Name | Provider | User Name | Host Name | Wildcard | Mail Exchanger | Backup MX | Offline | Status | Action                                                                               |
|----------------|-----------------|----------|-----------|-----------|----------|----------------|-----------|---------|--------|--------------------------------------------------------------------------------------|
| Add Connection |                 |          |           |           |          |                |           |         |        |  |

Press the **Refresh** button to update the status.

- Click the link 'Add Connection' to add a new connection; alternatively, click the icon under 'Action'; the 'Dynamic DNS' screen appears (refer to the figure).

- Configure the DDNS parameters. Use the table below as a reference.

**Table 13-4: Dynamic DNS Parameter Descriptions**

| Dynamic DNS Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection            | In a single WAN scenario, the connection parameter appears as static text (non-configurable). However, if you have multiple WAN devices, a combo-box appears (refer to the figure), enabling you to select the connection to which you would like to couple the DDNS service. The DDNS service only uses the chosen device, unless fail-over is enabled. In this case, the failed-to device will be used instead (assuming its route rules consent), until the chosen device is up again. |
| Provider              | Select your DDNS service provider. Currently, only dyndns.org is supported. Click Here to Initiate and Manage your Subscription Clicking this link opens a new browser page in <a href="http://www.dyndns.com/account/">http://www.dyndns.com/account/</a> .                                                                                                                                                                                                                              |
| User Name             | Enter your DDNS user name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Password              | Enter your DDNS password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Host Name             | Enter your full DDNS domain name.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Wildcard              | Select this check-box to enable use of special links such as <a href="http://www.&lt;yourhost&gt;.dyndns.org">www.&lt;yourhost&gt;.dyndns.org</a> .                                                                                                                                                                                                                                                                                                                                       |
| Mail Exchanger        | Enter your mail exchange server address, to redirect all e-mails arriving at your DDNS address to your mail server.                                                                                                                                                                                                                                                                                                                                                                       |
| Backup MX             | Select this check-box to designate the mail exchange server to be a backup server.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Offline               | To temporarily take your site offline (prevent traffic from reaching your DDNS domain name), check this box to enable redirection of DNS requests to an alternative, predefined URL. The availability of this feature depends on your DDNS account's level of service. The redirection URL must be configured through the account as well.                                                                                                                                                |

## 13.19 IP Address Distribution

Your gateway's Dynamic Host Configuration Protocol (DHCP) server makes it possible to easily add computers that are configured as DHCP clients to the home network. It provides a mechanism for allocating IP addresses and delivering network configuration parameters to such hosts. The gateway's default DHCP server is the LAN bridge.

A client (host) sends out a broadcast message on the LAN requesting an IP address for itself. The DHCP server then checks its list of available addresses and leases a local IP address to the host for a specific period of time and simultaneously designates this IP address as 'taken'. At this point the host is configured with an IP address for the duration of the lease.

The host can choose to renew an expiring lease or let it expire. If it chooses to renew a lease then it will also receive current information about network services, as it did with the original lease, allowing it to update its network configurations to reject any changes that may have occurred since it first connected to the network. If the host wishes to terminate a lease before its expiration it can send a release message to the DHCP server, which will then make the IP address available for use by others.

Your gateway's DHCP server:

- Displays a list of all DHCP host devices connected to the gateway
- Defines the range of IP addresses that can be allocated in the LAN
- Defines the length of time for which dynamic IP addresses are allocated
- Provides the above configurations for each LAN device and can be configured and enabled/disabled separately for each LAN device
- Can assign a static lease to a LAN PC so that it receives the same IP address each time it connects to the network, even if this IP address is within the range of addresses that the DHCP server may assign to other computers
- Provides the DNS server with the host name and IP address of each PC that is connected to the LAN

Additionally, the gateway can act as a DHCP relay, escalating DHCP responsibilities to a WAN DHCP server. In this case, the gateway will act merely as a router, while its LAN hosts will receive their IP addresses from a DHCP server on the WAN.

With the gateway's optional Zero Configuration Technology feature, the IP Auto Detection method detects statically-defined IP addresses in addition to the gateway's DHCP clients. It learns all the IP addresses on the LAN, and integrates the collected information with the database of the DHCP server. This allows the DHCP server to issue valid leases, thus avoiding conflicting IP addresses used by other computers in the network.

### 13.19.1 DHCP Server Parameters

- **To view a summary of the services currently being provided by the DHCP server:**
  - Click the icon 'IP Address Distribution' in the 'Advanced' screen; the 'IP Address Distribution' screen opens.

**Figure 13-26: DHCP Server Summary**

|  IP Address Distribution                                                                                                                  |             |               |                             |                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|---------------|-----------------------------|---------------------------------------------------------------------------------------|
| Name                                                                                                                                                                                                                         | Service     | Subnet Mask   | Dynamic IP Range            | Action                                                                                |
| WAN Ethernet                                                                                                                                                                                                                 | Disabled    |               |                             |  |
| LAN Ethernet                                                                                                                                                                                                                 | DHCP Server | 255.255.255.0 | 192.168.2.1 - 192.168.2.254 |  |
| <div>  Close            Connection List         </div> |             |               |                             |                                                                                       |

**Note:** If In the column 'Service' of the 'IP Address Distribution' screen, if a gateway is indicated 'Disabled', then DHCP services are not being provided to hosts connected to the network through that gateway. This means that the gateway will not assign IP addresses to these computers, which is useful if you wish to work with static IP addresses only.

➤ **To edit the DHCP server settings for a device:**

1. Under the column 'Action', click the icon 'Edit'; the DHCP Server settings for this device are displayed (refer to the figure).

**Figure 13-27: Advanced - IP Address Distribution - DHCP Server**

**DHCP Settings for LAN Ethernet**

**Service**

IP Address Distribution: DHCP Server

**DHCP Server**

Start IP Address: 192 .168 .2 .1

End IP Address: 192 .168 .2 .254

Subnet Mask: 255 .255 .255 .0

WINS Server: 0 .0 .0 .0

Lease Time In Minutes: 60

☒ Provide Host Name If Not Specified by Client

OK Apply Cancel

2. From the 'IP Address Distribution' drop-down list, select whether to enable or disable the DHCP server.
3. From the 'IP Address Distribution' drop-down list, select whether the gateway will function as a DHCP server or as DHCP relay. Choose 'DHCP Server'; the screen section 'DHCP Server' is displayed, showing the parameters described in the table below.

**Table 13-5: DHCP Server Parameter Descriptions**

| Parameter                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address Range (Start and End)             | Determines the number of hosts that may be connected to the network in this subnet. 'Start' specifies the first IP address that may be assigned in this subnet and 'End' specifies the last IP address in the range.                                                                                                                                                                                                                             |
| Subnet Mask                                  | A mask used to determine what subnet an IP address belongs to. An example of a subnet mask value is 255.255.0.0.                                                                                                                                                                                                                                                                                                                                 |
| Lease Time                                   | Each device will be assigned an IP address by the DHCP server for a limited time ('Lease Time') when it connects to the network. When the lease expires the server will determine if the computer has disconnected from the network. If it has, then the server may reassign this IP address to a newly-connected computer. This feature ensures that IP addresses that are not in use will become available for other computers on the network. |
| Provide host name if not specified by client | If the DHCP client does not have a host name, the Telephone Adapter will assign the client a default name.                                                                                                                                                                                                                                                                                                                                       |

➤ **To configure a DHCP relay server:**

1. From the 'IP Address Distribution' drop-down list, select 'DHCP Relay'; the screen 'DHCP Relay Server Address' opens (refer to the figure below). Use this screen to configure your DHCP server's IP address.

**Figure 13-28: DHCP Server Relay**

2. Click 'OK' to save your changes.

### 13.19.2 DHCP Relay Parameters

To configure a device as a DHCP relay, perform the following steps:

1. Select the 'DHCP Relay' option in the 'IP Address Distribution' drop-down list under the screen section 'Service' (refer to the figure).

**Figure 13-29: Advanced - IP Address Distribution - DHCP Relay**

IP DHCP Settings for LAN Ethernet

**Service**

IP Address Distribution: DHCP Relay

**DHCP Relay**

| Address        | Action |
|----------------|--------|
| New IP Address |        |

OK Apply Cancel

2. Click the link 'New IP Address'; the 'DHCP Relay Server Address' screen opens (refer to the figure).

**Figure 13-30: Advanced - IP Address Distribution - DHCP Relay - New IP Address**

IP DHCP Relay Server Address

IP Address: 1 0 0 0

OK Cancel

3. Specify the IP address of the DHCP server.
4. Click 'OK' to save the settings.
5. Click 'OK' once more in the 'DHCP Settings' screen.
6. Click the icon 'Network Connections' on the sidebar of the main screen; the screen 'Network Connections' opens.
7. Click the link 'WAN Ethernet'; the 'WAN Ethernet Properties' screen opens.
8. Press the button 'Settings'; the screen 'Configure WAN Ethernet' opens.
9. In the screen section 'Routing', select 'Advanced' from the drop-down list; the screen refreshes.
10. In the 'Routing Mode' drop-down list, select 'Route'; this changes the gateway's WAN to work in routing mode, which is necessary in order for DHCP relaying to function correctly.
11. Click 'OK' to save the settings.

### 13.19.3 DHCP Connections

- **To view a list of computers currently recognized by the DHCP server:**

1. Open the screen 'IP Address Distribution' and click button 'Connection List' (refer to the figure); the 'IP Address Distribution' screen opens.

**Figure 13-31: Advanced - IP Address Distribution - Connection List**

**IP DHCP Connections**

| Host Name                                                                                                        | IP Address  | Physical Address  | Lease Type | Connection Name | Status | Expires In | Action                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------|-------------|-------------------|------------|-----------------|--------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alan                                                                                                             | 192.168.2.2 | 00:90:27:1d:9d:f5 | Dynamic    | LAN Ethernet    | Active | 51 minutes |   |
| <b>New Static Connection</b>  |             |                   |            |                 |        |            |                                                                                                                                                                         |

Press the **Refresh** button to update the data.

- **To define a new connection with a fixed IP address:**

1. Click the link 'New Static Connection'; the screen 'DHCP Connection Settings' opens (refer to the figure).

**Figure 13-32: Advanced - IP Address Distribution - Connection List - New Static Connection**

**IP DHCP Connection Settings**

Host Name:

IP Address:

MAC Address:

2. Enter a host name for this connection.
3. Enter the fixed IP address to be assigned to the computer.
4. Enter the MAC address of the computer's network card.

**Note:** A device's fixed IP address is actually assigned to the specific network card's (NIC) MAC address installed on the LAN computer. If you replace this network card then you must update the device's entry in the DHCP Connections list with the new network card's MAC address.

- Click 'OK' to save the settings; the 'DHCP Connections' screen reappears displaying the defined static connection. This connection can be edited or deleted using the standard 'Action' icon.

## 13.20 DNS Server

Domain Name System (DNS) provides a service that translates domain names into IP addresses and vice versa. The Telephone Adapter's DNS server is an auto-learning DNS, which means that when a new computer is connected to the network the DNS server learns its name and automatically adds it to the DNS table. Other network users may immediately communicate with this computer using either its name or its IP address.

In addition your Telephone Adapter's DNS:

- Shares a common database of domain names and IP addresses with the DHCP server.
- Supports multiple subnets within the LAN simultaneously.
- Automatically appends a domain name to unqualified names.
- Allows new domain names to be added to the database using the MP-202's Web-based Management.
- Permits a computer to have multiple host names.
- Permits a host name to have multiple IPs (needed if a host has multiple network cards).

The DNS server does not require configuration. However, you may wish to view the list of computers known by the DNS, edit the host name or IP address of a computer on the list, or manually add a new computer to the list.

### 13.20.1 Viewing and Modifying the DNS Table

- **To view the list of computers stored in the DNS table:**
  - Click the icon 'DNS Server' in the 'Advanced' screen of the Web-based Management; the DNS table is displayed (refer to the figure).

**Figure 13-33: DNS Server**

| DNS Server    |            |        |                                                                                       |
|---------------|------------|--------|---------------------------------------------------------------------------------------|
| Host Name     | IP Address | Source | Action                                                                                |
| New DNS Entry |            |        |  |

➤ **To add a new entry to the list:**

1. Click the link 'New DNS Entry'; the 'DNS Entry' screen opens (refer to the figure).

**Figure 13-34: DNS Entry**

2. Enter the computer's host name and IP address.
  3. Click 'OK' to save your changes.
- **To edit the host name or IP address of an entry:**
1. Click the 'Edit' button under column 'Action'; the 'DNS Entry' screen opens.
  2. If the host was manually added to the DNS Table, you can modify its host name and/or IP address. If it wasn't, you can only modify its host name.
  3. Click 'OK' to save your changes.
- **To remove a host from the DNS table:**
- Click 'Delete' under column 'Action'; the entry is removed from the table.

## 13.21 Protocols

The Protocols feature incorporates a list of preset and user-defined applications and common port settings. You can use protocols in various security features such as Access Control and Port Forwarding. You may add new protocols to support new applications or edit existing ones according to your needs.

➤ **To define a protocol:**

1. Click the Advanced icon on the side-bar.

- Click the icon 'Protocols', the 'Protocols' screen appears (refer to the figure).

Figure 13-35: Advanced - Protocols

 **Protocols**

| Protocols        | Ports                          | Action                                                                                                                                                                      |
|------------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FTP              | TCP Any -> 21                  |       |
| HTTP             | TCP Any -> 80                  |       |
| HTTPS            | TCP Any -> 443                 |       |
| TFTP             | UDP 1024-65535 -> 69           |       |
| IMAP             | TCP Any -> 143                 |       |
| Ping             | ICMP Echo Request              |       |
| POP3             | TCP Any -> 110                 |       |
| SNMP             | UDP Any -> 161                 |       |
| SMTP             | TCP Any -> 25                  |       |
| Telnet           | TCP Any -> 23                  |       |
| L2TP             | UDP Any -> 1701                |       |
| Traceroute       | UDP 32769-65535 -> 33434-33523 |   |
| <b>New Entry</b> |                                |                                                                                        |

- Click the link 'New Entry'; the 'Edit Service' screen appears (refer to the figure).

Figure 13-36: Advanced - Protocols - Edit Service

 **Edit Service**

Service Name:

Service Description:

**Server Ports**

| Protocol                | Server Ports | Action                                                                                |
|-------------------------|--------------|---------------------------------------------------------------------------------------|
| <b>New Server Ports</b> |              |  |

4. Name the service in the parameter 'Service Name' and click the link 'New Service Ports'; the 'Edit Service Server Ports' screen appears (refer to the figure).

**Figure 13-37: Advanced - Protocols - Edit Service - Server Ports**

 Edit Service Server Ports

|                  |                      |
|------------------|----------------------|
| <b>Protocol</b>  | Other ▼              |
| Protocol Number: | <input type="text"/> |

5. You may choose any of the protocols available in the combo box, or add a new one by selecting 'Other'. When selecting a protocol from the combo box, the screen refreshes, presenting the respective fields by which to enter the relevant information.
6. Select a protocol and enter the relevant information.
7. Click OK to save the settings.

## 14 System Monitoring

The System Monitoring screen displays important system information, including:

- Key network device parameters
- Network traffic statistics
- The system log
- The length of time that has transpired since the system was last started
- Voice over IP

### 14.1 Connections

➤ **To monitor connections:**

1. Click the menu 'System Monitoring' in the left sidebar; the 'System Monitoring' screen, tab 'Connections', is displayed, showing a read-only summary (with the exception of linked parameter 'IP Address Distribution') of the monitored connection data (refer to the figure).

**Figure 14-1: System Monitoring - Connections**

| Name                    | WAN Ethernet           | LAN Ethernet      |
|-------------------------|------------------------|-------------------|
| Device Name             | eth0                   | eth1              |
| Status                  | Connected              | Connected         |
| Network                 | WAN                    | LAN               |
| Connection Type         | Ethernet               | Ethernet          |
| MAC Address             | 00:90:8f:09:ef:5e      | 00:90:8f:09:95:e2 |
| IP Address              | 10.33.2.42             | 192.168.2.1       |
| Subnet Mask             | 255.255.0.0            | 255.255.255.0     |
| Default Gateway         | 10.33.0.1              |                   |
| DNS Server              | 10.1.1.11<br>10.1.1.10 |                   |
| IP Address Distribution | Disabled               | DHCP Server       |
| Received Packets        | 199037                 | 10070             |
| Sent Packets            | 8766                   | 10956             |
| Time Span               | 12:00:41               | 12:00:41          |

2. Click the 'Refresh' button to update the display, or press the 'Automatic Refresh On' button to constantly update the displayed parameters.

## 14.2 Traffic

The gateway is constantly monitoring traffic within the local network and between the local network and the Internet. You can view up-to-the-second statistical information about data received from and transmitted to the Internet (WAN) and about data received from and transmitted to computers in the local network (LAN).

➤ **To view traffic statistics:**

- Click tab 'Traffic'; the 'System Monitoring - Traffic' screen opens.

**Figure 14-2: System Monitoring - Traffic**

## 14.3 System Log

The System Log displays a list of the most recent activity that has taken place on the gateway.

➤ **To open the system log:**

- Click tab 'System Log'; the 'System Monitoring - System Log' screen opens.

**Figure 14-3: System Monitoring - System Log**

| Time                | Event      | Event-Type | Details                                                                                                     |

## 14.4 System Up Time

➤ **To display the system up time:**

- Press tab 'System' to display the length of time that has passed since the system was last started.

**Figure 14-4: System Monitoring - System Up Time**

| System Has Been Up For: |  |
|-------------------------|--|
| 12 hours, 14 minutes    |  |

## 14.5 Voice over IP

### ➤ To monitor VoIP:

- Click tab 'Voice over IP'; the 'System Monitoring - Voice over IP' screen opens showing read-only VoIP call related parameters.

**Figure 14-5: Advanced - System Monitoring - VoIP**

## 15 Software and Hardware Specifications

**Note:** For the list of features available in the current software version, refer to the latest Release Notes.

**Table 15-1: MP-202 Telephone Adapter Software Specifications**

| Feature                  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                     |
